# NOVA MINERALS LTD (NVA.ASX)

## 9.9MOZ ESTELLE GOLD PROJECT IN ALASKA'S TINTINA GOLD BELT

## 1.0 SUMMARY

### PHASE 2 SCOPING STUDY >US\$654M NPV (A\$3.95/SHARE -85%)

NVA has the Estelle Gold Project in the premier Tintina Gold Belt that hosts >220moz in mostly bulk tonnage but high margin deposits. Current NVA market ratings are abysmally low against regional and local peers. Valued at <US\$1/resource oz (A\$1/oz). The recent Phase 2 Scoping Study defined a very profitable US\$654m pretax NPV<sub>5</sub> project with low capital cost (US\$385m) and intensity and a very attractive 53% IRR.

## 1.1 KEY POINTS

- Estelle project has very profitable project economics
- Resources established in 'District' wide tenements
- 10moz delineated at Estelle as total gold resources in just four years
- Major resource extension potential at several sites
- NVA is significantly discounted to
  - High value US\$654m (A\$975m) Estelle Gold Project NPV<sub>5</sub>
  - Tintina Gold Belt peers
  - ASX gold sector peers
- Market cap A\$55m @ A\$0.26 (>A\$40m liquids, EV = US\$10m)
- Recently NASDAQ-listed 9.4moz US GoldMining Inc - US\$185m mkt cap
- Explorer Snowline Gold – US\$350m market cap @ C\$3.58
- De Grey Mining 11.2moz A\$2,050m market cap @ A\$1.32

Alaska is the second largest gold producer in the US after Nevada with annual output >22 tonnes (>0.7moz) and being ~13% of US's 170tpa gold production.

The Tintina Gold Belt in Alaska and stretching into the Yukon is host to substantial gold deposits spreading within large 'Districts' and several major deposits just outside the Belt are amongst the largest undeveloped resources in the world.

NVA's >450km<sup>2</sup> Estelle 'District' scale project has the potential to sit amongst some of the larger deposits with four resources totalling 9.9moz and more to come near term.

The Phase 2 Scoping Study included the higher grade RPM deposits that allow >363koz to be produced in Year 1 to completely pay off the initial invested capital of US\$385m in less than a year and thereafter produce at >130kozpa for a further 16 years.

In just four short years NVA has delineated 10moz and with an additional 20 prospects along its 35 km strike has the potential to define >30moz in the longer term.

The Tintina Belt has some big names and a good track record of operational success so value in NVA should be recognized.

However, NVA's trading value against Tintina Gold Belt peers seems far too low.

#### Estelle Gold Project tenements

The Estelle Project is located in the mountains of the Tintina Belt American Cordillera Mobile Belt with mineralisation within the Mt Estelle Batholith intrusive rocks.

The Project is a District-size portfolio of contiguous tenements that run 35km N-S and about 8km E-W. Previous owners of the Estelle tenements had recognized numerous attractive prospects along much of the tenement so that NVA had helpful background.

Nova's initial focus was at Korbel then to previous drilling in the south at RPM.

NVA has drilled over 90,000m on the Estelle Gold Project for 10moz @ US\$11/oz cost.

The Estelle Gold Project currently consists of four at surface mineral deposits with along strike and at depth mineralisation potential and >20 other advanced prospects.

- **Korbel Main 6.6moz resource @ 0.3g/t bulk tonnage IRGS style**
  - Phase 2 Scoping Study complete and PFS underway
  - Link to Scoping Study [Investor Centre | Nova Minerals Limited](#)

### 3.0 NOVA MINERALS - A COMPARISON

*Estelle is a significant gold deposit in the Tintina Gold Belt*

*Other deposits are*

*Donlin Creek*

*Livengood*

*Casino*

*Whistler*

*Golden Summit*

**The Estelle Gold Project** is located in the western portion of the Tintina Belt 75km SW of Fairbanks and 150km NW of Anchorage.

The Tintina Belt is well known for its large low grade deposits with Pogo a high grade exception and a large number of smaller alluvial operations.

Three major mines are in production:- Fort Knox, Eagle and Pogo.

In addition to Estelle, five other large deposits are being developed.

- Donlin Creek
- Livengood
- Casino
- Whistler
- Golden Summit

**Figure 1 Estelle Gold Project and surrounding gold deposits**

Source: Nova Minerals

Two other projects include the 82moz Au Pebble near Anchorage and the 154moz Au KSM in Canada are very large porphyry copper style deposits located outside the Tintina Belt.

NVA's prospects along the N-S trending Estelle tenements are almost all IRGS and have already been identified. An important polymetallic vein deposit extending over 4,000m has been identified at Stoney.

The glaciated fresh rock mineralisation is relatively easy to follow and delineate and responds very well to IP geophysical surveys so that resources are rapidly grown.

**Figure 2 Estelle Gold Project- Multiple major target areas**

Source: Nova Minerals

*Four priority target areas defined*

*North to South*

*Korbelt*

*Cathedral*

*Stoney*

*Train/Trumpet*

*Shoeshine*

*RPM*

*NVA is very well positioned so should be at a premium*

## Comparison against Tintina Belt Peers

There is considerable value here at NVA's 9.9moz Estelle Gold Project which has already completed a Phase Two Scoping Study and is well advanced with its Preliminary Feasibility Study.

However, NVA's trade value is at a substantial discount to the US\$654m NPV described in the Scoping Study and also against Tintina Gold Belt gold project developer peers with a discount that seems far too great.

Stocks such as newly listed US GoldMining Inc with 9.4moz in similar rocks and adjacent to Estelle is priced at US\$185m and with an enterprise value ~10x higher.

Snowline Gold is also in the Tintina Belt in the Yukon with some very attractive gold drill results to date but yet to define a resource and has a market value of C\$473m (US\$350m) and an enterprise value 17x higher than NVA.

Table 4 Tintina Belt Explorers Comparisons

Stock	Code	Shares m	Price \$Local	Mkt Cap US\$m	\$Cm	A\$m	Cash/Liq US\$m	Ent Val US\$m	Resource mozAuEq	Ent Val US\$/oz
Snowline Gold Corp	SGD.V	132.2	3.44	337	455	509	30	307	0	
US Goldmining Inc	USGO	14.2	12.89	183	247	277	20	163	9.3	18
Nova Minerals Ltd	NVA	210.9	0.24	33	45	51	30	4	9.9	0

Figure 3 US Goldmining Inc

Figure 4 Snowline Gold Corp

Comparison against Tintina Belt peers

US GoldMining Inc with Whistler has US\$185m market cap

Snowline Gold has market cap of C\$473m

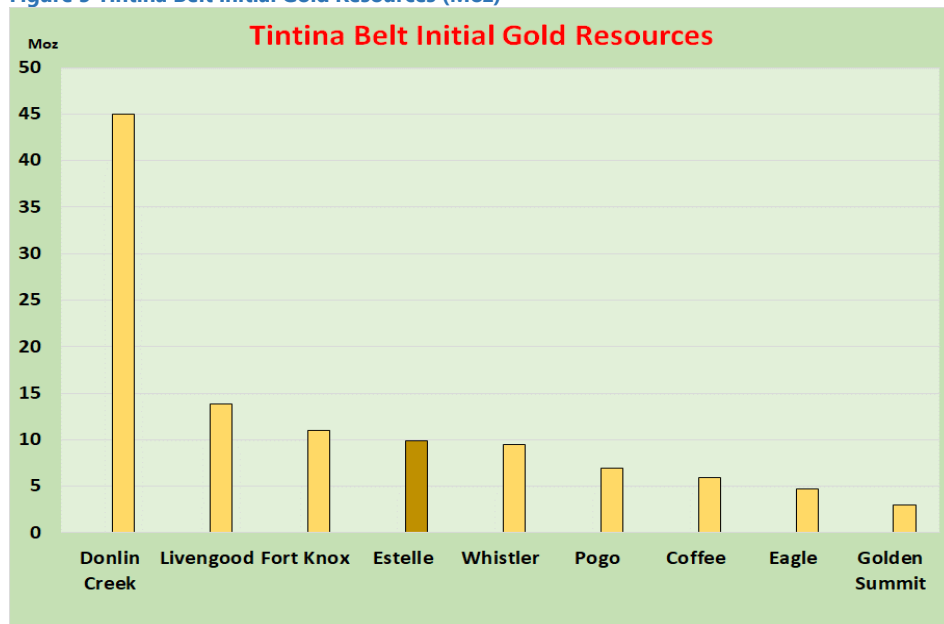

Recently listed US GoldMining Inc

Snowline Gold is close to all time highs

Estelle is # 4 in the Tintina Belt

The Estelle Gold Project is the 4th largest gold resource and is bigger than NST's Pogo.

Figure 5 Tintina Belt Initial Gold Resources (Moz)

Bigger than NST's Pogo.

Initial resource grades in these IRGS deposits are generally <1g/t

Source: various company reports MPS

Moreover, Estelle has equivalent initial resource grades to other major deposits in the Tintina Gold Belt.

Figure 6 Tintina Gold Belt Initial Resource grades (g/t)

Pogo is big exception

Donlin Creek is a higher grade IRGS

Source: various company reports MPS

The Estelle Gold Project will also have initial grades higher than current operating mines.

*Year One at Estelle will use RPM high grade ore and be higher than current open cut low grade operating mines*

*Pogo is much higher grade of course*

*Current low grade operations in the Tintina Belt*

#### **Kinross Fort Knox**

*Current mine grade 0.7g/t*

*Production costs of US\$9.76/t in March Qtr 2023*

#### **Victoria Gold Eagle Mine**

*Current mine grade 0.9g/t*

*Production costs of US\$20.8/t in March Qtr 2023*

**Figure 7 Mill grades- Projects vs Operating Mines**

Source: various company reports MPS

#### **Kinross - Fort Knox**

Kinross operates the Fort Knox heap leach in the same region and in the March Qtr 2023 at total production costs of US\$9.76/t and gross revenue of ~US\$14.65/t.

In 2022 Fort Knox had cashflow of US\$170m and pretax earnings of US\$58.9m.

#### **Victoria Gold - Eagle Mine**

Victoria Gold also operates a newly established low grade heap leach mine @ 0.9g/t at Dublin Gulch (Eagle Mine) in Canada with a much higher strip ratio.

Results in the March Qtr gave a robust C\$26m EBITDA on revenue of US\$1867/oz and Cash Costs of US\$1,115/oz and AISC of US\$1,410. Total production costs were US\$20.8/t.

The Full Year in 2022 gave EBITDA of C\$140m on received gold price of US\$1772, Cash Costs of US\$916/oz and AISC of US\$1,441/oz.

***This data proves that low grade ore mines can be built and operated successfully in this region.***

### Comparisons against ASX peers

These ASX Gold Resource Champions are a very small group of gold explorers with 10moz or more of resources.

De Grey Mining is developing its very successful Mallina Gold Project which has rapidly grown its resources to now more than 11moz.

Alkane is a modest gold producer and has 16moz primarily from its Kaiser-Boda porphyry deposit in NSW.

*NVA has ~A\$40m in cash and liquid assets*

ASX Gold Resource Champions							
	Price A\$	Shares m	Mkt cap A\$m	Ent Val A\$m	Resource moz	Grade g/t	Mkt cap A\$/oz

## 4.0 INVESTMENT REVIEW

10moz resources

The Nova Minerals 10moz Estelle Gold Project is one of the world's important undeveloped gold deposits.

Its location in the Tintina Gold Belt is a very good gold endowment region and the Estelle Batholith has provided many prospects for gold mineralisation that may become economic.

Exploration to date has already seen 10moz resources achieved in just over four years.

Four gold resources defined

The entire 35km of tenement length is prospective for IRGS deposits and other types.

Expansions and new deposits coming.

Figure 12 Nova Estelle Gold Project

Source: Nova Minerals

Over 90,000m drilling to date

NVA has been very active in Alaska since 2019 and has drilled over 90,000 metres in mostly diamond drilling in around 250 holes with its maiden resource in that first year.

Table 6 Estelle Drilling Data 2019-2022

Phase One Scoping Study in Feb 2022

1.956moz leading to NPV of US\$381m.

The success in resource delineation and growth has allowed NVA to move quickly to consider commencement of mining operations.

A Phase One Scoping Study in February 2022 based on just the Korbel Main deposit with a higher grade starter pit portion concluded that a 1.956moz resource could be economically mined over 13 years at US\$1750 and to produce a NPV of US\$381m.

The high grade RPM resource had not been delineated at the cut off for the Phase One Scoping Study.

NVA continued exploration and development and with the encouragement of the RPM high grade resource it completed a Phase Two Scoping Study which had the 4.7 mt @ 2.3g/t as the Year One starter pit to produce 363koz.

This high grade input provided strong cash flows that allowed repayment of capex within 11 months at US\$1800/oz and defined a US\$654m NPV<sub>5</sub>.

NVA has a strong commitment to technology and has incorporated ore sorters to treat the lower grade 0.4g/t Korbel Main ore that upgrades to 0.73g/t into the mill.

NVA Has also incorporated high pressure grinding rolling mills (HPGR) as a high efficiency flow sheet component.

The company is moving towards a full PFS due by end 2024.

Alaska produces ~25tonnes of gold pa with Fort Knox and Pogo providing around 9 tonnes each but Estelle's Year One could deliver 11.5 tonnes and make it Alaska's largest mine for the year.

The economic and technical aspects of the Estelle gold project would make it a full member of the Tintina Gold Belt.

Current operations at Fort Knox and the Eagle Mine confirmed low cost bulk tonnage mining works.

**The overall conclusion is that NVA is trading at a massive discount to most peer assets.**

The Directors have made significant investments in NVA and have participated in all capital raisings and have been buying on market in this weak price period as reported.

*Phase One Scoping Study was US\$381m pretax NPV to produce 1.956moz and 20.4% IRR a with payback in three years.*

*Phase Two Scoping Study gives US\$654m pretax NPV<sub>5</sub> on 2.25moz and*

*ore sorters*

*88.3% recovery that should be improved through optimisation*

*high grades from RPM make the rapid capital payback within 11 months*

*Year One output 363koz at US\$100/t revenue and US\$11/t mining and processing costs*

**Margin not grade**

#### 4.1 The Estelle Gold Project – Phase 2 Scoping Study

Nova Minerals presented an initial US\$424m capex Scoping Study in February 2022 that showed a viable gold mining operation could be established based on the Korbel Main deposit producing 1.956moz with a NPV<sub>5</sub> of US\$381m and 20.4% IRR at US\$1750/oz.

The project would commence with a high grade starter pit providing 200koz in Year 1 and cash flow positive operations that would have given payback of 3 years.

Encouraging drill results at RPM subsequent to commencement of the Scoping Study were converted into a much higher grade deposit particularly at RPM North. This would significantly change the starter pit operation from 1 g/t to 2.02g/t in the initial year, reduce initial capital costs and give a payback in just 11 months at US \$1800/oz.

This high grade RPM North resource would feed at 2.02g/t in Year One to give 363koz at AISC of US\$510/oz.

##### Key Points

- **Total production of 2.25moz over + 17 years mine life**
- **Year One production of 363koz and LoM average 132kozpa**
- **Year One AISC US\$510/oz and US\$1149/oz over LoM**
- **NPV<sub>5</sub> pretax of US\$654m (A\$970m)**
- **11 month payback**
- **Ore sorters introduced in Year 2**
- **Only 23% of Estelle 9.9moz resource assumed**
- **88.3% recoveries with additional optimisation benefits possible**
- **The 2moz Cathedral resource is not included in the scoping study**

NVA has carried out a thorough upgraded Scoping Study for the Estelle Gold Project that takes into account the higher grade resource at RPM North that could be trucked 25km to the Korbel plant and would produce an impressive 363,000oz in the first year.

The mine would be a low cost, low strip ratio open pit with truck and shovel operation feeding into a conventional mill operation with initial high grade ore feed then modular ore sorters delivering 0.73g/t to the circuit.

The mine sequencing takes these higher grades from RPM first.

**Table 9 RPM Resources.**

Deposit	Category	Tonnes Mt	Grade Au g/t	Au Moz
RPM North	Measured	1.4	4.1	0.18
	Indicated	3.3	1.5	0.16
	M & I	4.7	2.3	0.34
	Inferred	26	0.6	0.48
	Subtotal	31	0.8	0.82
RPM South	Inferred	31	0.4	0.42
<b>RPM Mining Complex</b>	<b>Total</b>	<b>62</b>	<b>0.6</b>	<b>1.24</b>

The M & I resources at RPM North are 4.7mt @ 2.3g/t containing 340koz and are at surface with a very low strip ratio so 2g/t at US\$58/g (US\$51/g recovered) gives US\$100/t revenue with operating costs of ~US\$11/t.

This is clearly a matter of margin and not grade.

RPM North will be mined first followed by RPM South and then Korbel ore will be fed into ore sorters to reduce the mass pull for treatment to just 43% of the initial feed.

Stacked mineralised veins are typical of IRGS deposits in the Tintina Belt.

Obvious here at the Train Prospect

This material is ideal for ore sorting

363koz in Year One.

High revenue and low operating cost/tonne.

The character of the rocks of granitic Estelle Batholith is one of homogeneity in the host rock and significant difference in the mineralised material.

The IRGS deposits in the Tintina Gold Belt show the stacked mineralised veins in the granitic matrix.

Subparallel fractures in the brittle granitic material allow the penetration of the mineralised quartz veins.

This graphic shows Estelle rocks (on left) against those mineralised rocks for Kinross’s Fort Knox and Victoria Gold’s Eagle (Dry Gulch) mine.

Figure 13 Rock description Tintina Belt Gold Deposits

Figure 7-1: A comparison of sheeted quartz veins found at the Estelle property (image on the left) to other deposits (image on the right) that share similar geologic depositional environments (right image taken from Goldfarb et. al., 2007)

NVA has done considerable work with ore sorting machines that deliver very attractive results of reducing the tonnage of material to be milled and retaining a high proportion of the contained gold.

The ore sorters will allow 14.9mtpa of ore to be crushed but only 43% (6.4mtpa) of the ore will be milled while still capturing 88% of the gold.

NVA will be able to maintain gold output above 100kozpa while mining only 0.4g/t which is upgraded and treated at around 0.7g/t .

Figure 14 Estelle Gold Project Annual Gold Production

Source: Nova Minerals

At 2g/t gross this is US\$100/t net revenue

Margin very high in Year One ....

But positive margins there after

Mining and processing costs around only US\$11.20/t mined at 14.9mtpa.

After ore sorting, costs are US\$31.88/t on 6.35mtpa processed.

Improvement in recoveries from 88.3% to a projected 92.5% would produce ~4.5% more gold

(~100koz = US\$180m over LoM)

The high gold production level in Year One comes from the RPM North grades at 2.02g/t average that provide a revenue of US\$100/tonne.

The margin declines over time but assumes no other higher grade ore will be mined.

Figure 15 Estelle Gold Project Per Tonne Revenue, Costs and Margins

The cost structure shows mining costs and processing costs for RPM North ores in Year One will be only US\$11.20 per tonne and Year Two and beyond after the ore sorting the mill feed will be upgraded to 0.7g/t and cost \$31.88 per tonne.

Table 10 Ore Mining and Processing Costs

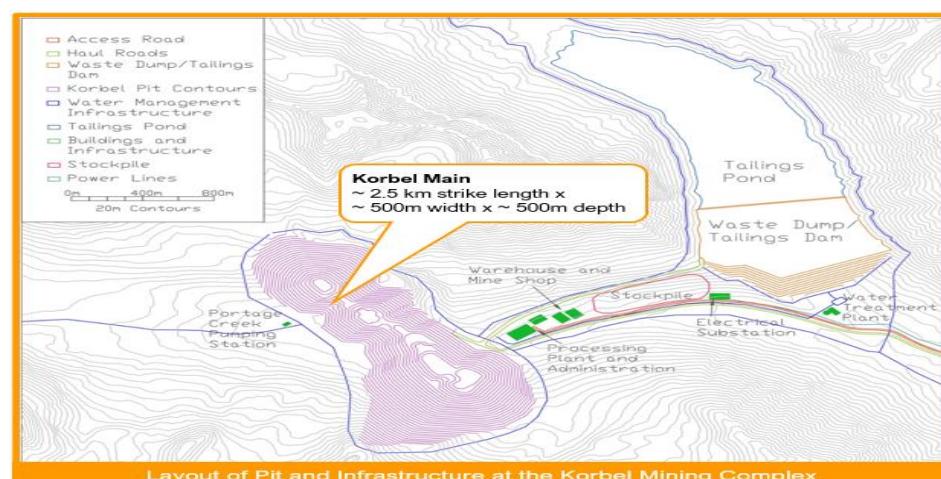

Operating Costs	\$/t Ore Mined	\$/t Through Process
Mining	\$4.81	\$1.65
Particle Sorting	\$0.51	\$0.73
Milling & Flotation	\$3.35	\$7.14
Fine Grind & Leach	\$0.66	\$16.91
Stockpiling	\$0.09	\$0.20
G&A	\$1.30	\$1.30
RPM Haul	\$0.48	\$3.95
<b>Total</b>	<b>\$11.20</b>	<b>\$31.88</b>

Source: Nova Minerals

The mine plan would take the RPM ores first direct to the mill then Korbel ores would be crushed, treated through the ore sorters at a capacity of 14.9mtpa reducing to 6.35mtpa through the HPGR then to a ball mill then to flotation cells and a conventional leaching plant.

NVA is reviewing ways to improve the recovery of the fines portion that could achieve an overall recovery of 92.5% that would produce ~4.5% more gold (~100koz or US\$180m additional revenue)

Figure 16 Korbel Mine Configuration

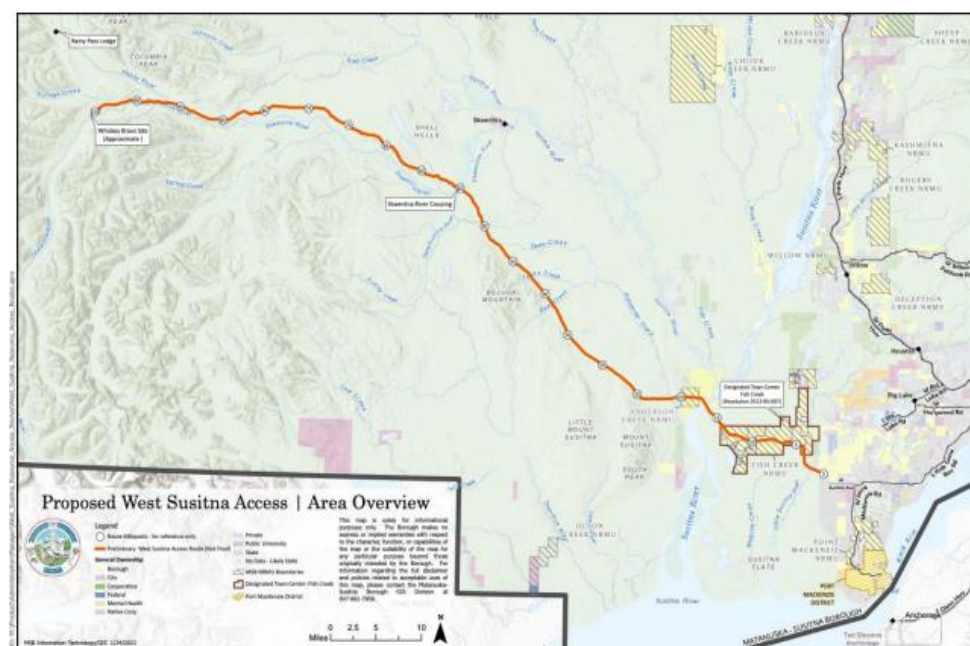

Source: Nova Minerals

The flowchart illustrates the gold processing plant layout, starting with a truck delivering material to a Primary Crusher. The material then moves to a Screener, which separates it into 'Korbel High Grade' (sent to a Crushed Ore Stockpile) and 'Korbel Low Grade' (sent to an Ore Sorter). The Ore Sorter rejects material to a Reject Stock Pile and sends the rest to a Secondary Crusher. The Secondary Crusher feeds into a Milling Circuit, which then feeds into a Flotation Circuit (95.4% Recovery). The Flotation Circuit sends material to a Tailing Thickener & Tailing Pond and a Regrind Circuit. The Regrind Circuit feeds into Intensive Leaching (96.2% Recovery), which then feeds into Adsorption/Desorption. The Adsorption/Desorption unit feeds into Electrowinning, which feeds into a Gold Furnace, finally producing Gold Bars.

An important part of the Scoping Study and the PFS is the construction of a new all weather road from Port Mackenzie (across the river from Anchorage) to the Estelle Gold Project site. This road would service Estelle and the Whistler Project developments.

### Figure 18 Proposed West Susitna Access Road

16 Nova Minerals – Martin Place Securities - July 2023

*Estelle Batholith is the basic geology*

*Glaciated so fresh rock at surface*

*Glacial moraine present but most regions have no transported cover or deep weathered zones*

*Korbel*

*RPM*

*Train/Trumpet are similar to RPM*

*Stoney has polymetallic potential*

*And much more.*

The Estelle Batholith extends throughout the 35 km of the tenements North-South and hosts significant mineralisation.

It is a single intrusive mass with local variation but the glaciation effects on fresh rock provides extensive outcrop that can be relatively quickly assessed without much deep weathered surface cover in this terrain.

Consequently it can be considered as prospective major trend that carries numerous deposits with potential for over 30moz.

The tenements have had previous owners who have already identified prospective targets.

NVA has >20 exploration targets with resource potential.

The Korbel Main Deposit has Cathedral as well as nearby targets Block C & D, Sweet Jenny, You Beauty, Isabella and Portage Pass.

RPM in the south has additional resource potential.

Train/Trumpet are within 7km of RPM and NVA expects to be able to determine a significant near term resource here.

Stoney in the centre of the tenements has had very high grades of gold, silver and copper in a 4,000m vein giving polymetallic resource potential.

Numerous other targets have been Identified.

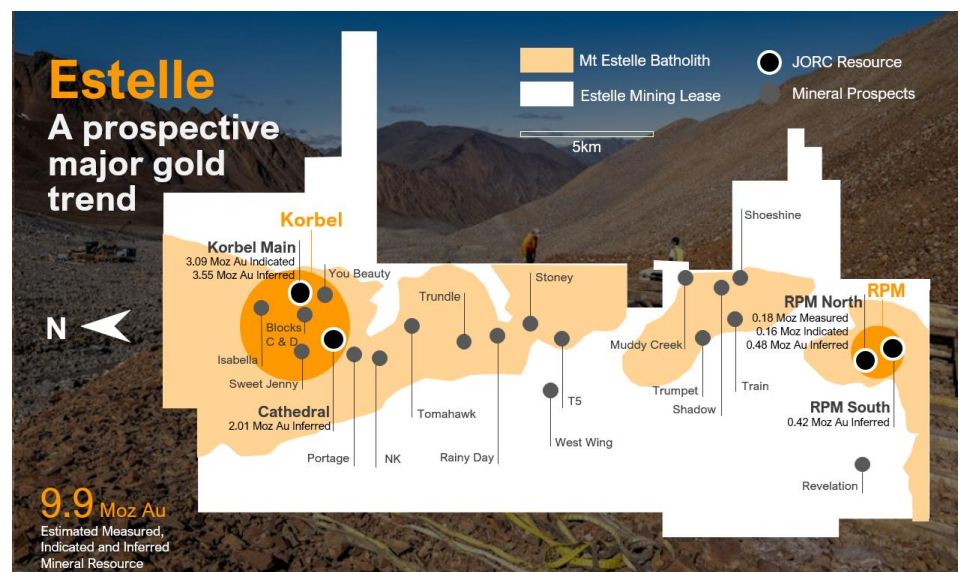

Estelle has real potential of >30moz.

As will be shown, Alaska is the second largest US gold producer after Nevada.

Estelle, with 35km of strike has the potential of becoming a 'District' that could have a mini Nevada's Carlin Trend potential.

Nova has recognized that these tenements are strategically located in a highly prospective geological terrane.

**Figure 19 Estelle Gold project Prospects**

Source: Nova Minerals

## 4.3 VALUATION PROCESS

*NPVs are very useful parameters in valuations.*

*But rely on the capital being marshalled and successfully applied*

*Eagle was an attractive project for financiers*

*Livengood has a very high capex*

*Estelle is much lower and gives an 11 month payback*

*Could NVA achieve a non equity diluting funding for this?*

*The Phase 2 Scoping study Sensitivity to gold price changes*

NVA holds 85% of the project

NVA's 85% share in US\$m

NVA's 85% share in A\$m

NVA clearly has a resource that can support an economic mining operation and the resource base having grown so quickly could be expected to show strong growth.

Whilst the average grade is low, higher grade deposits are very likely to be found and be added to the feed into the central processing plant at Korbel.

The key issue then becomes the approach to giving value to these tenements.

The NPV is the sum of the net cash flows adjusted by the discount rate and depends on the initial capex as well as the net operating cash flows.

The capex for the Phase Two Scoping Study for Estelle is US\$385m giving a capital intensity over 2.25moz of US\$171/oz

Victoria Gold's Eagle Mine Capex was C\$487m (US\$365m 2019) over 3.3moz and had a capital intensity of C\$147m(US\$110 2019)/mined oz.

International Tower's Livengood project has US\$1,930m capex over 6.6moz for a capital intensity of US\$293/ mined oz.

Estelle's lower capital intensity along with the Year One 363koz in higher grade ore giving <12 months payback is likely to be very attractive to financiers.

The Estelle project has very high value leverage to a higher US\$ gold price.

**Table 11 Estelle Phase 2 Scoping Study NPV Ranges in US\$m**

NPV US\$m				
US\$/oz	1800	2000	2200	2500
5.0%	654	923	1213	1648
7.5%	504	744	983	1343
10.0%	402	604	805	1107

NVA holds 85% of the project.

**Figure 20 Estelle Gold Project NVA 85% share in US\$m**

NPV US\$m		NVA share		
US\$/oz	1800	2000	2200	2500
5.0%	556	785	1031	1401
7.5%	428	632	836	1141
10.0%	342	513	684	941

NVA is trading well below this valuation

**Figure 21 Estelle Gold Project NVA share in A\$m**

NPV A\$m		NVA share		
US\$/oz	1800	2000	2200	2500
5.0%	830	1171	1539	2091
7.5%	639	943	1248	1704
10.0%	510	766	1021	1404

NVA's NPV share in A\$/share.

Figure 22 Estelle Gold Project Value per NVA share

NPV A\$/NVA share				
US\$/oz	1800	2000	2200	2500
5.0%	3.93	5.55	7.30	9.92
7.5%	3.03	4.47	5.92	8.08
10.0%	2.42	3.63	4.84	6.66

NVA's 85% NPV in A\$ per share

Even a 10% discount rate and US\$1,800/oz this is A\$2.42 on the undiluted capital.

>10x the current market cap

Estelle is valued at <A\$2/oz of 10moz going to 30moz!

The market place is giving no value to the NPV of the Estelle Gold project's Phase Two Scoping Study.

These figures are an order of magnitude over the current share value of A\$55m (@A\$0.26/share) and especially when NVA has A\$45m of liquid assets making up the A\$55m.

**The Estelle Gold Project's net enterprise value is just A\$10m or ~ A\$0.05/share.**

**Gold in the ground for A\$1/oz!**

ASX gold sector companies have value in the gold for Inferred Resources of A\$20-60/oz.

NVA should be valued at least at A\$1.21/share

In ground valuation A\$m				
A\$/oz Inferred Resource				
moz	30	40	50	60
9.0	230	306	383	459
9.5	242	323	404	485

10.5	1.27	1.69	2.12	2.54
11.0	1.33	1.77	2.22	2.66
11.5	1.39	1.85	2.32	2.78
12.0	1.45	1.93	2.42	2.90
12.5	1.51	2.02	2.52	3.02

## 5.0 ALASKA GEOLOGY

*Gold deposits in Alaska form in a wide range of rock types and substructures in wide zones along these faults.*

*Alaska has a very active geological history including being part of the Pacific Ring of Fire.*

*Dynamic mobile belts create fertile geological environments.*

The geology of Alaska is a collection of various terrains that have come together on the western margin of North America over the period of 30-100m years ago and make up the North American Cordillera. The region comprises island arc granitic batholiths and associated volcanic rocks of Jurassic, Cretaceous and early Tertiary age.

The region has a history of multiple magmatic events and associated with gold, a wide range of base and precious metals and hydrothermal sulphide bearing mineralization.

The local geology is characterized by a thick succession of Cretaceous volcanic sedimentary rocks intruded by a diverse suite of plutonic rocks.

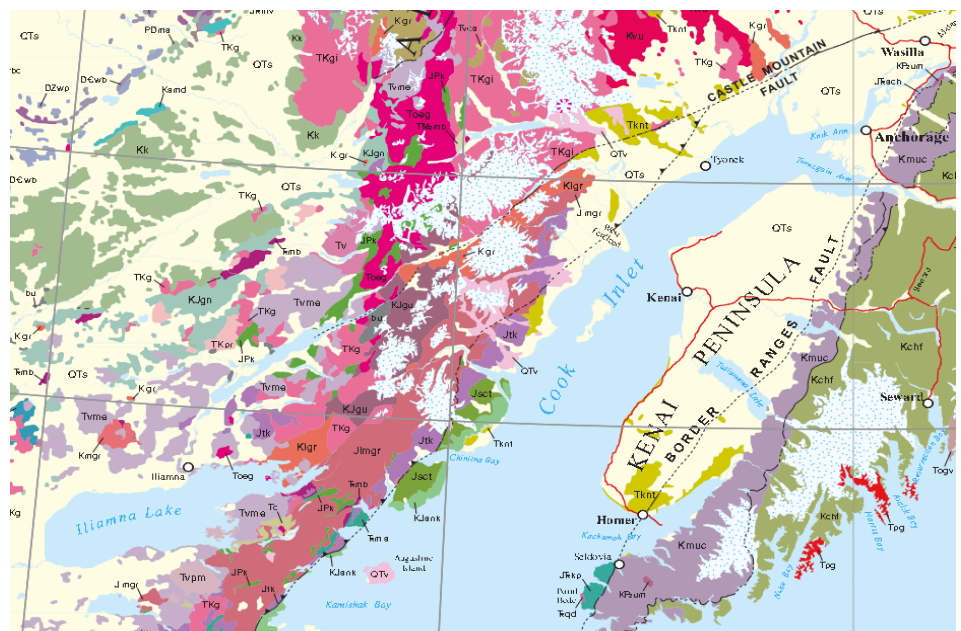

**Figure 23 Alaska and the North American Cordillera**

Source: Google Maps

The Mt Estelle Batholith is one of these plutons and is the key feature in Nova's tenements.

**Figure 24 Estelle Gold Project with the domains of Alaskan Geology**

Source: Google Maps

*Estelle Batholith is an important regional pluton*

## 6.0 ALASKA GOLD MINING

*US produces ~170 tonnes pa but this has been declining over the past 8 years and is 25% down and heading lower.*

*Nevada has ~75% share of this but it too has been in decline with ~25% fall since 2018.*

*Alaska makes up about 13% of US gold production but has the potential to become more significant*

The US is one of the world's largest gold producers with around 170 tonnes pa with Nevada the premier gold state with ~ 75% of the output.

Alaska produces around 25 tonnes (~.7moz) making it the second largest with around 13%.

**Figure 25 United States Annual Gold Production 2010 - 2022**

Source: USGS MPS

The bulk of Alaskan output comes from two major mines, Fort Knox and Pogo, each producing ~9 tonnes pa, and also numerous alluvial operations that combine to produce about 5-6tpa.

The renewal by NST at Pogo is lifting Alaskan output.

**Figure 26 Alaskan Gold Production 2010 -2022 and share of US Gold Output**

Source: USGS MPS

*Fort Knox and Pogo are Alaska's major mines...*

*Along with numerous smaller alluvial operations*

*Alaska should continue to increase its share of US gold production*

Alaska has in addition to the Estelle development, the massive 45moz Donlin Creek Project, the 9.4moz Whistler porphyry copper deposits and the Livengood project.

Northern Dynasty's giant 118moz Pebble gold/copper/moly porphyry is still a potential development but is held up by green tape.

Estelle will have the opportunity to become Alaska's largest gold producer for a year.

Figure 27 Alaskan Gold Production – History and forecast

Estelle could have a major impact on the Alaskan output in Year One 2027/28.

Mine	2021	2022	2023E	2024E	2025E	2026E	2027E	2028E
Fort Knox	8.3	9.1	8.8	9.0	9.0	9.0	9.0	9.0
Pogo	5.8	7.6	8.0	8.5	9.0	9.0	9.0	9.0
Estelle							11.3	4.8
Other	5.9	5.5	5.5	5.0	5.0	5.0	5.0	5.0
Total	20.0	22.2	22.3	22.5	23.0	23.0	34.3	27.8
Estelle share	0%	0%	0%	0%	0%	0%	33%	17%

Source: USGS MPS

The Tintina Gold Belt has several significant large gold deposits and Estelle stands well rated as #4 and with potential to move up in the table to #2.

Figure 28 Tintina Belt Gold Deposits Initial Resources

Estelle is # 4 in the Tintina Gold Belt resource size.

Bigger than Pogo.

Source: Various companies MPS

Note the preponderance of low grade IRGS gold deposits and also gold porphyries with associated copper.

Figure 29 Tintina Gold Belt Initial Resource Grades

Tintina Belt grades are generally low

Pogo at 9.4g/t is the major exception

Source: Various companies MPS

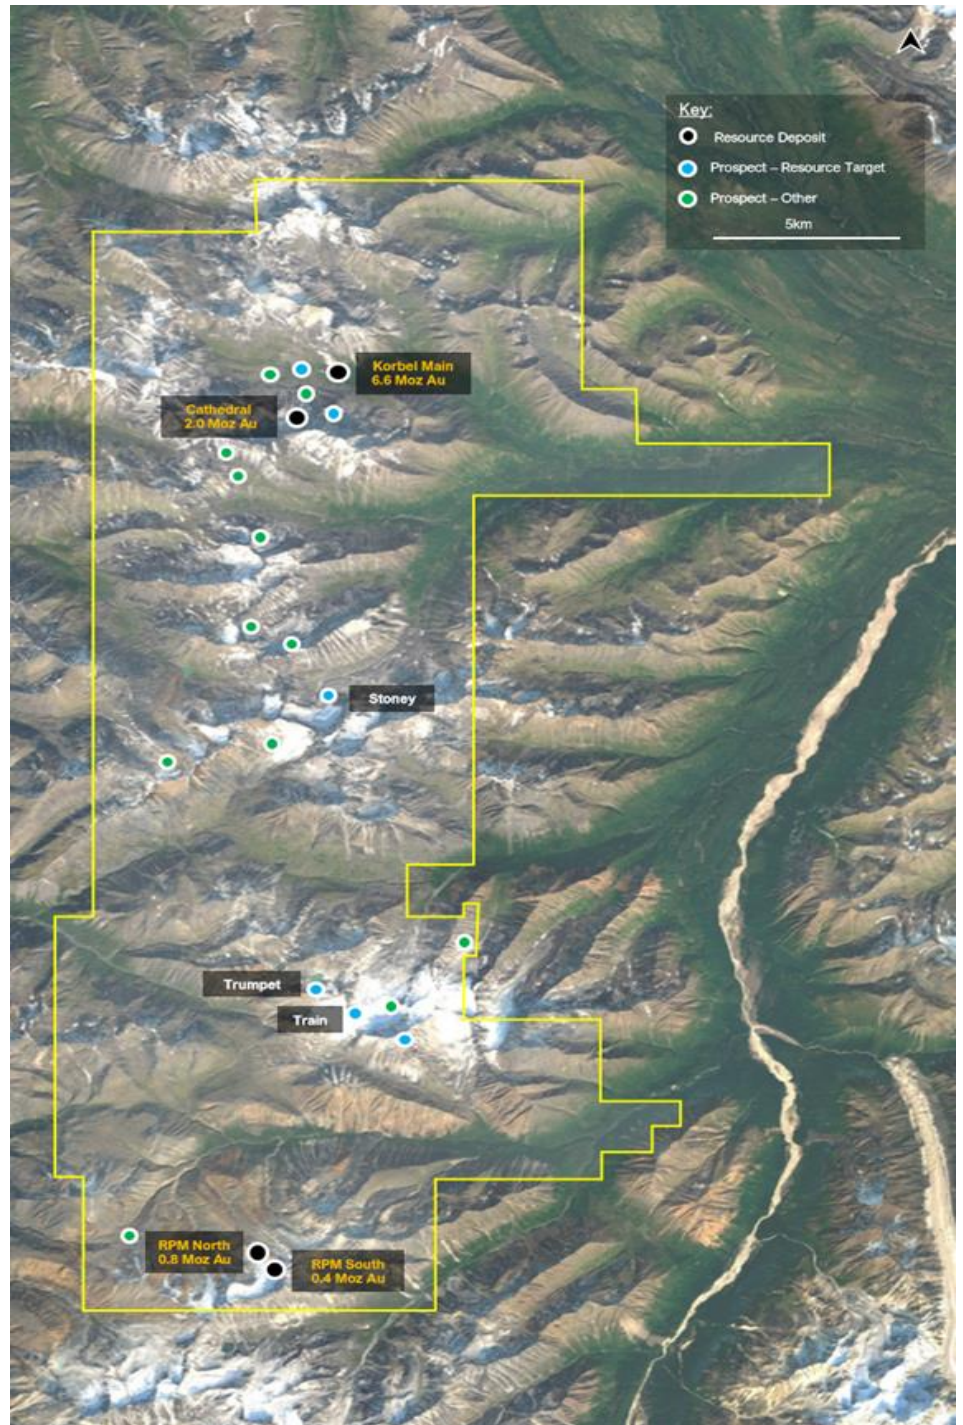

## 7.0 NOVA ESTELLE GOLD PROJECT

### The Geology and the Resources

#### Key Points

- IRGS gold mineralisation discovered along 35km of strike
- Korbel Main has 6.64moz resource
  - Nearby deposits at Cathedral (2.01moz)
  - Nearby prospects at Blocks C&D Isabel
- RPM in the south has 1.24moz
  - RPM North 0.82moz
  - RPM South 0.42 moz
- IRGS gold exploration targets at Trumpet, Train, Shoeshine et al
- Base and precious metals targets porphyry copper at Stoney

Figure 30 Estelle Gold Project Tenement

Source: Nova Minerals

#### *Intrusion Related Gold Systems – IRGS*

*IRGS mineralisation over 35km  
in four resource deposits so far*

*Geology and landform are  
conducive to large low grade  
mineralisation*

*Long intersections*

*Numerous very high grade rock  
chip samples*

*Sheeted vein outcrops traceable  
over large distances*

*10moz resources achieved in  
just four years*

*Increases expected in existing  
resources*

*Discovery of new resources*

*>30moz possible*

*Estelle Batholith provides heat engine for mineralising fluids.*

*Glaciation has left large areas as primary outcrop.*

*Outcrop and rock chip sampling is a very effective exploration combination*

*The Estelle Batholith is a regional play over >30km in this District*

*Estelle Gold Project has 10moz already*

*Considerable potential for significant increases to existing resources is obvious from drilling to date and outcrop.*

*Other prospects have the combination of outcrop and rock chip and geochem to anticipate further substantial resources*

*>30moz is a likely MPS expectation over the next several years*

The Estelle Gold Project has developed on the Estelle Batholith which is a plutonic intrusion exhibiting numerous examples of mineralisation.

The Estelle Project tenements have a typical elevation around 700 metres but local relief can be as high as 1800m.

The area is heavily glaciated leaving much outcropping although other parts are covered by heavy glacial moraine.

The landform has allowed geologists to see mineralisation outcropping and occurring as large scale mineralised sections.

The Estelle prospects have all had high grade rock chips taken from outcrops indicating a highly mineralised system throughout the length of the Estelle Batholith.

This mineralized granitic intrusion has good internal homogeneity and the project has been highlighted by remarkably long mineralised intersections in drilling on all targets to date. Consequently, large resources can be quickly established.

The Korb Main deposit was the first resource to be delineated but it is clear from the initial resources results at RPM and Cathedral and the outcrop sampling from Train, Trumpet and Shoeshine that a much larger resource is likely to be defined over time.

The resource numbers in this region can be very large.

MPS projections based on geological evidence to date.

Nova Minerals Estelle Targets	Resources Potential				moz
	Current	Near term	Longer term	Total	
<b>Korb Main</b>	<b>6.64</b>	<b>1</b>	<b>5</b>	<b>13</b>	
<b>Cathedral</b>	<b>2.01</b>		<b>3</b>	<b>5</b>

<b>Total</b>	<b>9.89</b>	<b>7</b>	<b>15</b>	<b>32</b>	

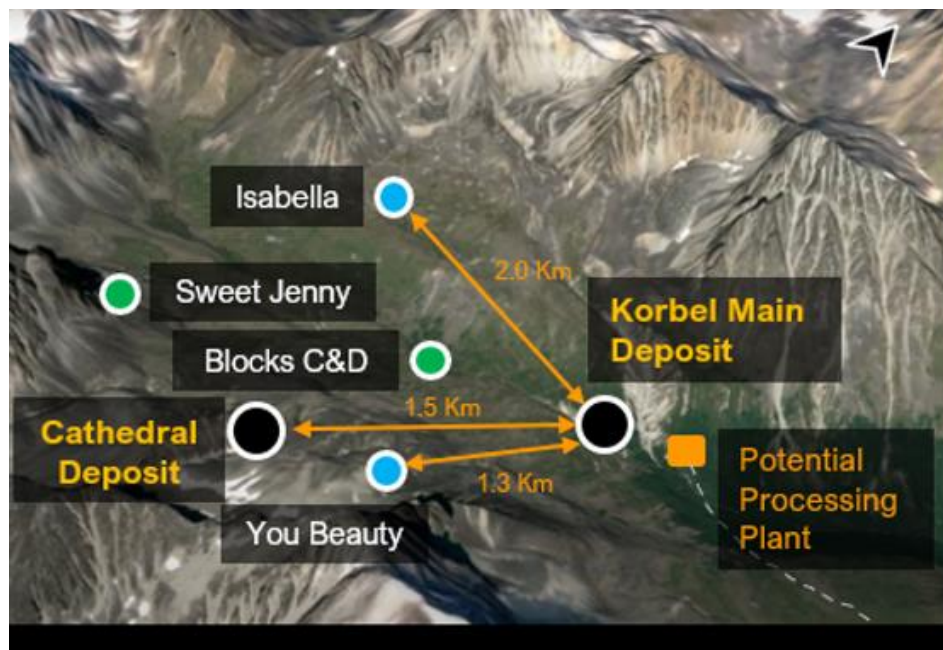

## 7.1 KORBEL MAIN

### Key Points

- Flagship initial resources at Estelle
- 6.64moz and still open
- Base for 6.4mtpa central processing plant
- Long intersections of mineralisation noted
- Nearby attractive prospects
- 2.01moz Cathedral resource only 1,500m away (post Scoping Study)

The long intersections of mineralisation at Korbel provide strong indications of a large mineralised system that can support a high volume low grade mining operation.

**Figure 31 Korbel Main Region with Nearby Prospects**

Source: Nova Minerals

Intersections of over 500m are very encouraging and higher grade sections >0.5g/t are highly profitable at US\$58/g with mining and processing costs under US\$12/t.

**Table 12 Korbel Drill Intersections examples**

Initial Estelle Gold Project resource base

Korbel Main has nearby high potential targets

Very long intersections recorded

With some long higher grade zones

249m @ 0.6g/t

549m @ 0.3g/t

367m @ 0.4g/t

385m @ 0.4g/t

The Mineral Resource Estimates (MRE) have given 800mt @ 0.26g/t with 40% in the Indicated category and totalling 6.64moz.

At US\$58/g this is ~US\$13/t net against mining costs of US\$11.20/t.

For Indicated resources at 0.30g/t this is ~US\$15/t.

Using ore sorters the mill grade becomes 0.7g/t or ~US\$40/t

**Table 13 Korbelt Main Mineral Resource Estimates at various cutoff grades**

800mt resource extending over 3,000m

Additional resources potential at depth and along strike

Source: Nova Minerals

## 7.2 RPM

### Key Points

1.24moz and potential for more.

High grade feed for Year One throughput

- High grade starter pit ore for initial mining
- RPM North 0.82moz
- RPM South 0.42moz
- Connecting link between North and South being tested
- Considerable additional resources potential

RPM had been drilled by others in 2012 with a 178m intersection of 0.8g/t including 120m @ 1.0g/t and was followed up by NVA with some very high grade rock chip samples that included those in Table 15.

**Table 15 RPM Rock chip samples**

RPM	Rock chip samples		g/t				
	291	103	13.1	9.3	9.0	8.8	5.0

Source: Nova Minerals

The market was amazed by RPM -005 at RPM North

400m @ 3.5g/t including 123m @ 10.8g/t

### RPM North

A very impressive RPM-005 in Oct 2021 provided 400m @ 3.5g/t from surface and included 123m @ 10.8g/t which unfortunately was very narrow in the ore zone.

Nevertheless other long intersections with high grade intercepts (e.g. 117m @ 11.1g/t, 87m @ 10.1g/t, 80m @ 9.8g/t) provided sufficient data for a resource to be delineated at surface with a low strip ratio.

**Table 16 RPM North Drill Results**

RPM North			
	m	g/t	Depth from
RPM-005	400	3.5	0
	373	3.8	7
	287	4.8	7

Source: Nova Minerals

Drilling at RPM has provided the two resources and current NVA thinking is that the two may be linked.

Drilling is planned to test for this link as set out in the centre of the Figure 34 below. Each of RPM North and RPM South are open along strike.

The plan view at RPM shows two sub parallel intrusions running roughly NW-SE.

RPM North provided some high grade rock chips and the impressive drill results at RPM-005 with 400m @ 3.5g/t including 132m @ 10.1g/t which contributed to the Measured and Indicated resource of 4.7mt @ 2.3g/t and 340koz.

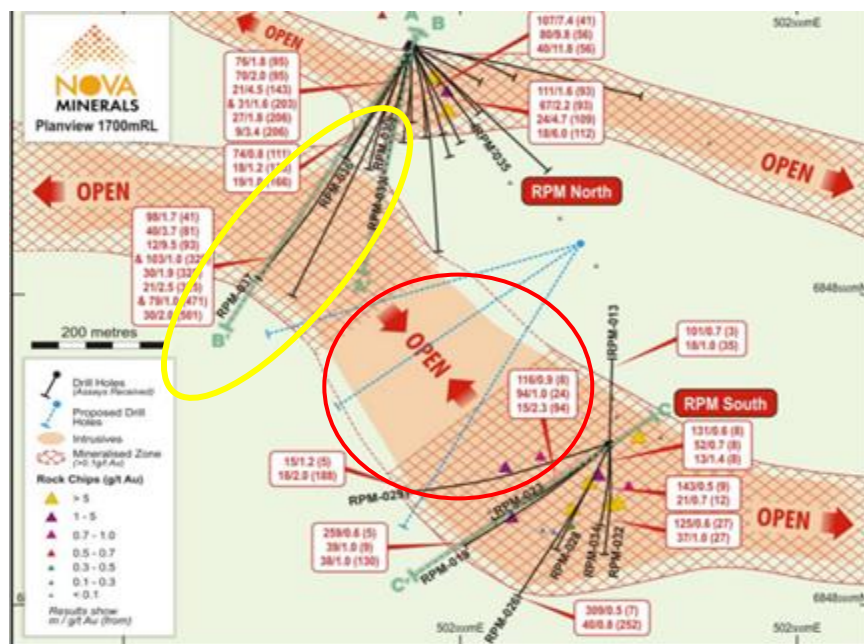

Drill hole RMP-037 oriented SSW-NNE delivered 152m @ 1.3g/t including 100m @ 1.7g/t and indicated a second sub parallel intrusion which has some higher grades (yellow oval).

NVA currently considers RPM S as an extension to that second intrusion zone on a NW-SE trend.

A new pad is likely to be set up soon to drill test that open gap zone (red circle) for continuity.

This could generate a significant upgrade for the RPM resources.

Figure 34 RPM North and RPM South Drill Traces

Source: Nova Minerals

Figure 35 Cross section of RPM N drilling RPM -037 intersecting second intrusive body

Source: Nova Minerals

RPM has two separate resources at RPM N and RPM S

RPM N is a cut off high grade deposit in the north on one section of an intrusive.

But drill data suggests a second sub parallel intrusive body that is likely to be trending SE down to RPM S

Drill testing is likely in early Sept Qtr to test the potential link between the SW section of RPM N and the RPM S resource

The high grade RPM N resource is to the east

The drill trace for RPM-037 shows the second intrusive body with 103m @ 1.0g/t and 79m @ 1.0g/t

This drilling has provided the basis for a Mineral Resource Estimate that included 180koz @ 4.12g/t.

#### RPM N

Measured resource 180koz @ 4.12g/t

Indicated resource 160koz @ 1.51g/t

Inferred resource 26mt @ 0.58g/t

### 7.3 CATHEDRAL

#### Key Points

- 2.01moz initial Inferred Resource established
  - Potential for much more
- Only 1,500m from Korbel Main
- Resource not included in the Scoping Study
- Initial strike length 800m and 350m wide
- >5,000m diamond drilling
- Long drill traces of gold mineralisation
  - E.g. - 354m @ 0.3g/t
- High grade rock chip samples
  - 114g/t, 37.1g/t 24.5g/t 98.3g/t

2.01moz initial Inferred Resource

Long intersections of gold mineralisation

800m x 350m with scope for a much larger resource

The Cathedral target at Korbel has always been an attraction given the high grade rock chip samples that had been collected early in Nova's ownership of the Estelle Project.

The scale of this mineralisation is 800m x 350m and gives considerable scope for a much larger resource than the initial 2.01moz.

Cathedral is only 1,500m up a mountain from Korbel Main.

These rock chip samples at Cathedral have been quite impressive keeping in mind this is outcrop in unweathered granitic material.

**Table 21 Cathedral 2020 Rock Chips Sampling Programme**

Cathedral	Rock chip samples			g/t		
114	37.1	4.8	11.1	7.5	24.5	98.3

Source: Nova Minerals

The surface samples encouraged Nova to drill beneath them and the first drill hole provided 354 metres @ 0.3g/t.

**Figure 36 Cathedral Exploration Results – Cross Section**

Source: Nova Minerals

Long intersections under high grade surface samples

Drilling has provided long intersections with some high grade zones

High grades within long intersections

354m @ 0.3g/t

269m @ 0.4g/t

360m @ 0.3g/t

Table 22 Cathedral Drill Intersections

Cathedral	m	g/t	Depth from
CTDD-001	354	0.3	104
	11	1.1	123
CTDD- 003B	269	0.4	168
	70	0.6	335
	3	2.7	393
CTDD- 005	350	0.3	90
	93	0.5	202

Source: Nova Minerals

Potential for additional resources will be tested in additional holes from a drill pad higher up the mountain.

Figure 38 Cathedral Follow Up Drilling Programme

Source: Nova Minerals

Advanced targets likely to deliver resources in 2023

Located just 7km N of RPM

Drill rigs on site in this field season

Large outcrops of mineralised rock are easy to see, sample and map.

Sheeted vein systems observed at Train like this occur at Korbel, Fort Knox and Eagle Mine.

impressive grades in rock chip samples.

#### 7.4 TRAIN TRUMPET SHOESHINE TARGETS – WITHIN 7KM OF RPM

##### Key Points

- Multiple occurrences of mineralisation
- Advanced RPM style targets likely to deliver resources in 2023
- Train is large IRGS gold system 1,000m x 500m
  - Rock chip samples incl 80.2g/t, 30.4g/t, 24.5g/t
  - RPM style sheeted vein system deposit
- Trumpet is similar RPM style sheeted vein system deposit
  - Rock chip samples incl 32.8g/t, 16.6g/t, 16.0g/t
- NVA to soon drill test for the link from Train to Trumpet over 1,500m
- Shoeshine IRGS target just 1,500m away to East
- Located within 7km of RPM deposits

The rocks in the southern third of the Estelle tenements are highly mineralized and provide some outstanding resource prospects in addition to the RPM deposits.

The rocks here outcrop to readily display any mineralisation and this can be followed as fresh rock at surface over large distances.

NVA considers the Train-Trumpet prospects very similar to RPM and are aligned in the same NW-SE orientation.

**Figure 39 Train-Trumpet targets near RPM**

Source: Nova Minerals

The 1,500m long veins between Train and Trumpet has been sampled with very encouraging results and also an extension to Shoeshine has been identified.

**Table 24 Train-Trumpet-Shoeshine Rock Chip Samples Gold Grades**

Rock Chip Samples					
Target	g/t				
Train	80.2	17.9	17.7	16.6	10.4
Trumpet	32.8	16.6	16.0	13.6	12.7
Shoeshine	30.4	24.5	21.6	7.5	5.7

Source: Nova Minerals

NVA has been able to observe outcrop of two very significant mineralised veins at Train and follow them 1,500m to Trumpet.

Note that this landform does not have the transported cover and deep surface weathering encountered in much of Australia so the exploration approaches and techniques are very different here.

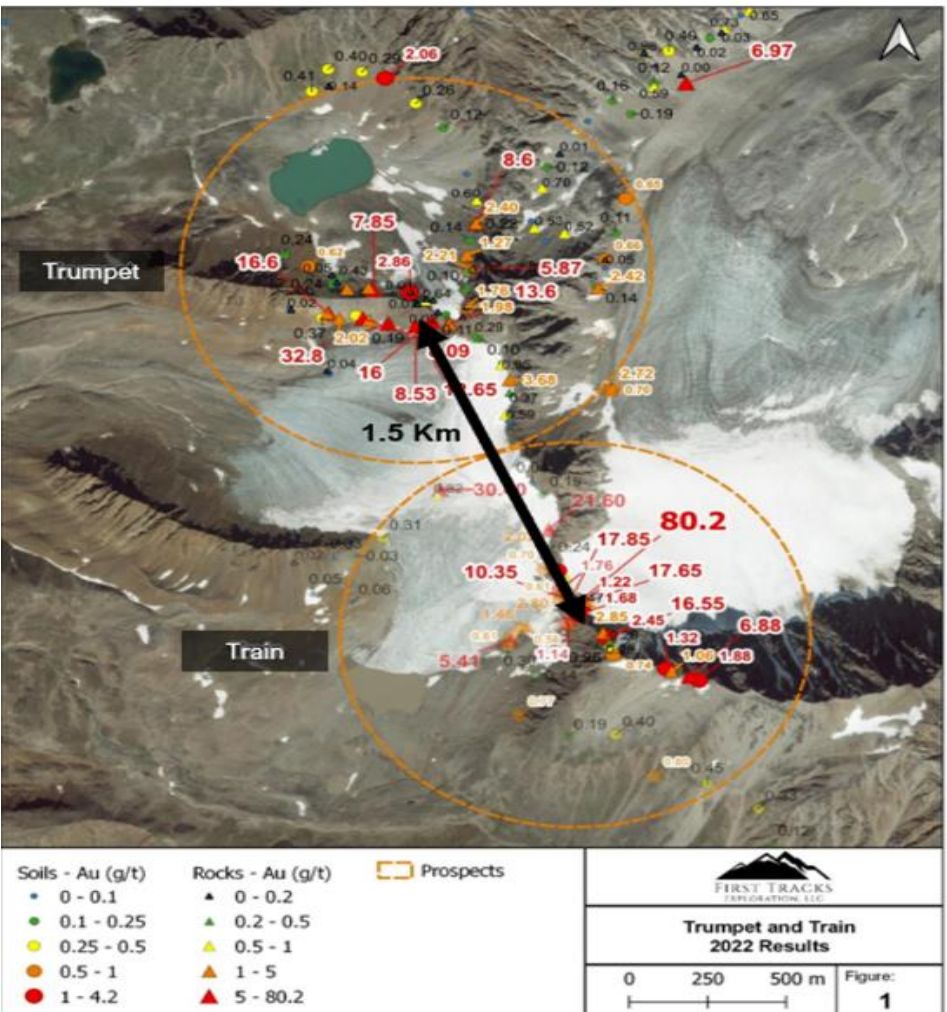

Figure 40 Outcrop of Mineralised Vein at Train

Source: Nova Minerals

NVA will be drilling this in Sept Qtr and should deliver an inferred resource.

Figure 41 Outcrop Rock Chip Sampling Train-Trumpet Link

## 7.5 STONEY TYPE TARGETS

### Key Points

- Multi metal deposits in central area of Estelle tenements
- Hosted in granodiorites
- Polymetallic Stoney Prospect 4km long
  - Two veins up to 10m wide
  - Very high grade samples taken
  - **48.4g/t Au, 2720g/t Ag, 2.4% Cu**

The Estelle Gold Project tenements have numerous mineralisation occurrences throughout the 35km N-S length and whilst the resources at Korbel Main, Cathedral and RPM are IRGS-types there are other mineralisation styles discovered that are similar to the adjacent Whistler deposits.

Within the central area of the tenements Nova has identified several mineralised areas with Stoney and its high grade polymetallic samples are of great significance.

Figure 42 Central Estelle Targets

Source: Nova Minerals

The Stoney Project has massive polymetallic mineralised veining observed over 4,000m along strike with width of up to 10m and >300m vertical extent.

The high grade polymetallic samples have included one with **48.4g/t Au, 2720g/t Ag, 2.4% Cu**

As at Train and Trumpet, mineralised surface outcrop can be readily observed and followed over large distances and here this vein is seen over 4,000m.

Figure 43 Outcropping Mineralised Vein

Source: Nova Minerals

*Multi element deposits similar to nearby Whistler mineralisation*

*Located in centre of Estelle tenements*

*Stoney is key prospect amongst many.*

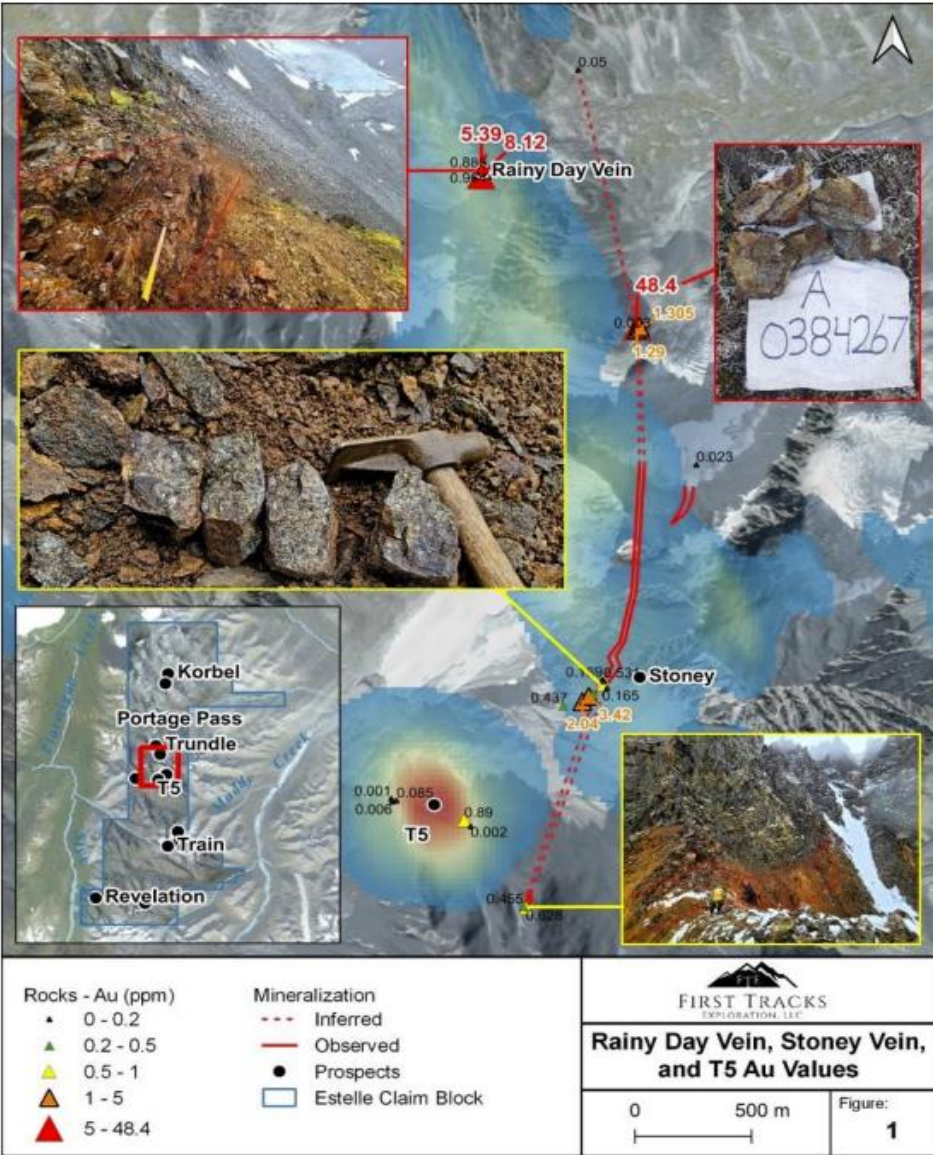

**One sample graded 48.4g/t Au, 2720g/t Ag, 2.4% Cu**

*Clearly obvious surface outcrop of mineralised vein*

The mineralised vein can be followed from south of Stoney over 4,000m to Rainy Day to the North.

Figure 44 Earth Picture of Stoney Mineralised 4km Vein

Mineralised outcrop is readily followed over large distances.

## 8.0 OTHER ASSETS

NASDAQ-listed Lithium developer in Manitoba Canada

Indicated resource of 9mt @ 1.0% Li<sub>2</sub>O

Resource upgrade due July 2023

Targetting 160tpa lithium ore concentrate

NVA sold down 31% for US\$18m (A\$24m)

Currently worth A\$25m (A\$0.12/sh)

Timetable

### Snow Lake Resources (NVA 37%)

#### Key Points

- NASDAQ-listed Lithium developer in Manitoba Canada
- Thompson Bros pegmatite Lithium resource
  - Indicated Resource 9mt @ 1.00% Li<sub>2</sub>O
  - Inferred Resource 2mt @ 0.98% Li<sub>2</sub>O
- Recent drilling to lead to resource upgrade in July 2023
- Targetting 160ktpa 6% lithium ore concentrate operation
- Currently worth A\$25m to NVA

The Thompson Brothers Lithium Project is based on a tabular and near vertical dyke that defined over 1,000m along strike and to a vertical depth of 500m.

The deposit averages 7 to 10m in true width consistent Li<sub>2</sub>O grades of ~1% and is ideal for underground mining.

NVA spun out its 100% interest in the lithium project into Snow Lake Resources in November 2021 whilst retaining 68% and sold a further 31% in 2022 to crystallise US\$18m in net cash and currently holds a 37% interest through 6.6m shares currently worth US\$17m (A\$25m and A\$0.12/share).

### UPCOMING CATALYSTS FOR FUTURE GROWTH

## 9.0 CORPORATE INFORMATION

### 9.1 DIRECTORS OF NOVA MINERALS

#### **Louie Simens** **Exec Chairman**

Louie has been an Executive Director of Nova since 2017. He is responsible for managing the company's core business operations which requires oversight of company-wide operational efficiencies and working with management and the board to review and implement strategic plans to facilitate growth.

#### **Christopher Gertersein** **Managing Director**

Chris as CEO controls all aspects of the Estelle Gold project while implementing efficiencies and savings to keep cost per discovery ounce well below industry average. He has over 20 years of experience as a professional geologist with an extensive record of managing and advancing complex and challenging resource projects across North America, Australia, and Asia.

#### **Craig Bentley** **Finance Director**

Craig is responsible for finance, compliance and risk management, as well as assisting with the company's strategy during Nova's forecast rapid growth period. He has over 30 years commercial and finance experience working in senior roles within multinational private enterprises and in auditing for Ernst and Young.

#### **Rodrigo Pasqua** **Non-exec Director**

Rodrigo is a mining engineer whose skills encompass most aspects of underground and open pit engineering. He has a vast experience in unlocking the value of mining projects across the world including specific expertise in large tonnage bulk mining operations at his tenure at Evolution Mining Limited as Group Head of Mining and Transformation.

#### **Avi Geller** **Non-exec Director**

Avi has extensive investment experience and a deep knowledge of corporate finance, including capital markets, venture capital, hybrid, debt and private equity. He served as Chief Investment Officer of Leonite Capital, a family office he co-founded focusing on real estate and capital markets. Mr. Geller also serves as a director of the real estate company Parkit Enterprise

<b>Closing</b>		<b>4,197</b>	<b>15,516</b>	<b>21,278</b>	<b>24,979</b>

Cashflows

NVA has an operating burn rate that is strongly seasonal with the Alaskan summer and June Half Year.

## **GENERAL SECURITIES – ADVICE WARNING**

---

Martin Place Securities makes no representation and gives no warranties to the accuracy or reliability of any information contained in this document and does not accept any liability for any loss caused by representations, errors or omissions on the part of Martin Place Securities or by any of their respective officers, employees or agents. In preparing this information, Martin Place Securities did not take into account the investment objectives, financial situation and particular needs of the reader.

Before making an investment decision on the basis of this information, the reader needs to consider, with or without the assistance of an adviser, whether the advice is appropriate in light of their particular investment needs, objectives and financial circumstances.

## **ANALYST VERIFICATION**

Barry Dawes, as the author of this report, and as Head of Resources of Martin Place Securities, hereby certifies that the views expressed in this research accurately reflect his personal views about the subject securities or issuers. No part of analyst compensation is directly or indirectly related to the inclusion of specific recommendations or views in this research. The analyst principally responsible for the preparation of this research has received compensation based on overall revenues, including investment banking revenues, of Martin Place Securities. The Analyst has taken reasonable care to achieve and maintain independence unbiased objectivity in making any recommendations.

The Analyst and his related entities hold no shares in NVA at the date of this report.

## **RESEARCH DISCLAIMER**

Investment Research provided has been prepared for the general use of the clients of Martin Place Securities. If you are not the intended recipient, you must not use or disclose the information in this research in any way. Nothing in this research shall be construed as a solicitation to buy or sell any security or product, or to engage in or refrain from engaging in any transaction. In preparing this research, we did not take into account the investment objectives, financial situation and particular needs of the reader. Before making an investment decision on the basis of this research, the reader needs to consider, with or without the assistance of an adviser, whether the advice is appropriate in light of their particular investment needs, objectives and financial circumstances. There are risks involved in securities trading. The price of securities can and does fluctuate, and an individual security may even become valueless. International investors are reminded of the additional risks inherent in international investments, such as currency fluctuations and international stock market or economic conditions, which may adversely affect the value.

This report has been prepared with the assistance of NVA and the views are entirely those of the Analyst using public available information.
