ASX: CXO

20<sup>th</sup> October 2016

## Further High Grade Lithium Intersections Finniss Lithium Project

### HIGHLIGHTS

- Additional high grade lithium assays have been returned in new results from Core's maiden drilling program at the Finniss Lithium Project
- New assay results from the Finniss Lithium Project include:
  - 40m @ 1.66% Li<sub>2</sub>O from 58m (FRC018) at Grants Prospect, including:
    - 10m @ 2.02% Li<sub>2</sub>O from 65m
    - 5m @ 2.05% Li<sub>2</sub>O from 84m
    - 1m @ 3.23% Li<sub>2</sub>O from 85m
  - 31m @ 1.61% from 68m (FRC017) at Grants Prospect, including:
    - 4m @ 2.01% from 83m
  - 19m @ 0.68% Li<sub>2</sub>O (FRC014) at Ahoys Prospect
- Previous results from Core's maiden drilling program at the Finniss Lithium Project include:
  - 49m @ 1.78% Li<sub>2</sub>O from 71m (FRC007) at Grants Prospect
  - 34m @ 1.60% Li<sub>2</sub>O from 71m (FRC003) at BP33 Prospect
- These additional significant spodumene intersections together with the previous high grade results from multiple prospects confirm Core's Finniss Lithium Project as a major new lithium discovery
- Results from Core's maiden drilling program will be used to prioritise the appraisal of more than 10 pegmatite prospects within Core's Finniss Lithium Project
- Current aggressive drilling program at Finniss will continue until the start of the upcoming wet season, expected in late November
- Update on initial diamond core drilling at Finniss expected next week

Core Exploration Ltd (ASX: CXO) (“Core” or the “Company”) is pleased to announce additional high grade lithium drill intersections from the Company’s maiden drilling program on the 100%-owned Finniss Lithium Project (“Finniss”), which consisted of 18 RC holes drilled on the Grants, BP33, Ahoy, Hills and Far West prospects. Significant levels of lithium mineralisation as spodumene were intersected at all prospects drilled except for Hills (Table 1 and Figure 3). Best results from this new batch of assays included:

- 40m @ 1.66% Li<sub>2</sub>O from 58m (FRC0018) at Grants Prospect, including:
  - 10m @ 2.02% Li<sub>2</sub>O from 65m;
  - 5m @ 2.05% Li<sub>2</sub>O from 84m;
  - 1m @ 3.23% Li<sub>2</sub>O from 85m; and
- 31m @ 1.61% from 68m (FRC0017) at Grants Prospect, including :
  - 4m @ 2.01% from 83m; and
- 19m @ 0.68% Li<sub>2</sub>O (FRC014) at Ahoy Prospect.

These new high grade spodumene intersections together with the previously announced high grade intersections from Grants and BP33 prospect, confirms Finniss as a major new discovery of high grade lithium (Table 1 and Figures 1-4).

Core has to date prioritised and has plans to drill more than 10 separate pegmatites prospects across the Finniss Lithium Project, which include the very large Zola Pegmatite and the Ringwood Pegmatite Swarms.

### **Ongoing Drilling Program at Finniss Lithium Project**

Core’s current drilling program on other lithium pegmatite targets at Finniss will continue for as long as possible until the start of the Northern Territory wet season which is expected to commence around late November.

The first diamond core drilling on the Finniss Lithium Project is currently underway at BP33 Prospect. The diamond drill rig is then expected to move to Grants next week to follow-up the exciting results at Grants.

Core’s substantial Phase 2 exploration and follow-up RC drilling program is expected to commence shortly.

Results from the ongoing drilling program will be released to the market as results become available with an update on the current diamond drilling program expected next week.

## **Transfer of 100% of EL 29698 to Core**

Core is also pleased to confirm that recently acquired tenement EL 29698, which includes each of the recently drilled prospects, has now been transferred and registered to Core. As a result of the transfer, Core is now a 100% owner of all its lithium tenure in the NT.

## **Background to the Finniss Lithium Project**

Core holds the largest lithium tenure position in the NT, including the highest grade lithium drill intersections, the largest historic pegmatite mine and at least another 25 other recorded pegmatites mines in the Northern Territory.

The discovery of high grade zones of lithium with the Company's first drill program at Finniss is very significant for Core given the scale of some of the new pegmatites identified by the Company's current field programs are directly comparable to the scale of pegmatites hosting large lithium resources in Western Australia.

Core's 100%-owned Finniss Lithium Project comprises a large tenement position of 480km<sup>2</sup>, has substantial infrastructure advantages being close to grid power, gas and rail infrastructure and within easy trucking distance by sealed road to the multi-user port facility at Darwin Port - Australia's nearest port to Asia.

Core's Managing Director, Stephen Biggins said:

*"We are once again extremely pleased with the results of the recent assays. We have only drilled five of a large number of pegmatite prospects within the Finniss Lithium Project, so to have discovered such high grade lithium intersections at both the Grants and BP33 prospects in the first few drill holes exceeded our expectations.*

*Core's work to date has only scratched the surface of the lithium potential of the Finniss Lithium Project, given the number of pegmatite targets within Core's tenure including the large scale Zola Pegmatite and Ringwood Pegmatite Swarm.*

*With more than \$7m cash at bank and an aggressive drilling program currently underway, Core is well placed to capitalise on the huge potential of the Finniss Lithium Project which we believe has the grade, potential scale and infrastructure to be compared with some of the best lithium projects under development in Australia."*

Hole No.	Prospect	East	North		Interval (m)	Li <sub>2</sub> O(%)	From(m)

Table 1. New significant lithium assay results in RC drilling, Finnis Lithium Project NT. Mean grades have been calculated on a 0.4% Li<sub>2</sub>O lower cut-off grade with no upper cut-off grade applied, and maximum internal waste of 2.0 metres.

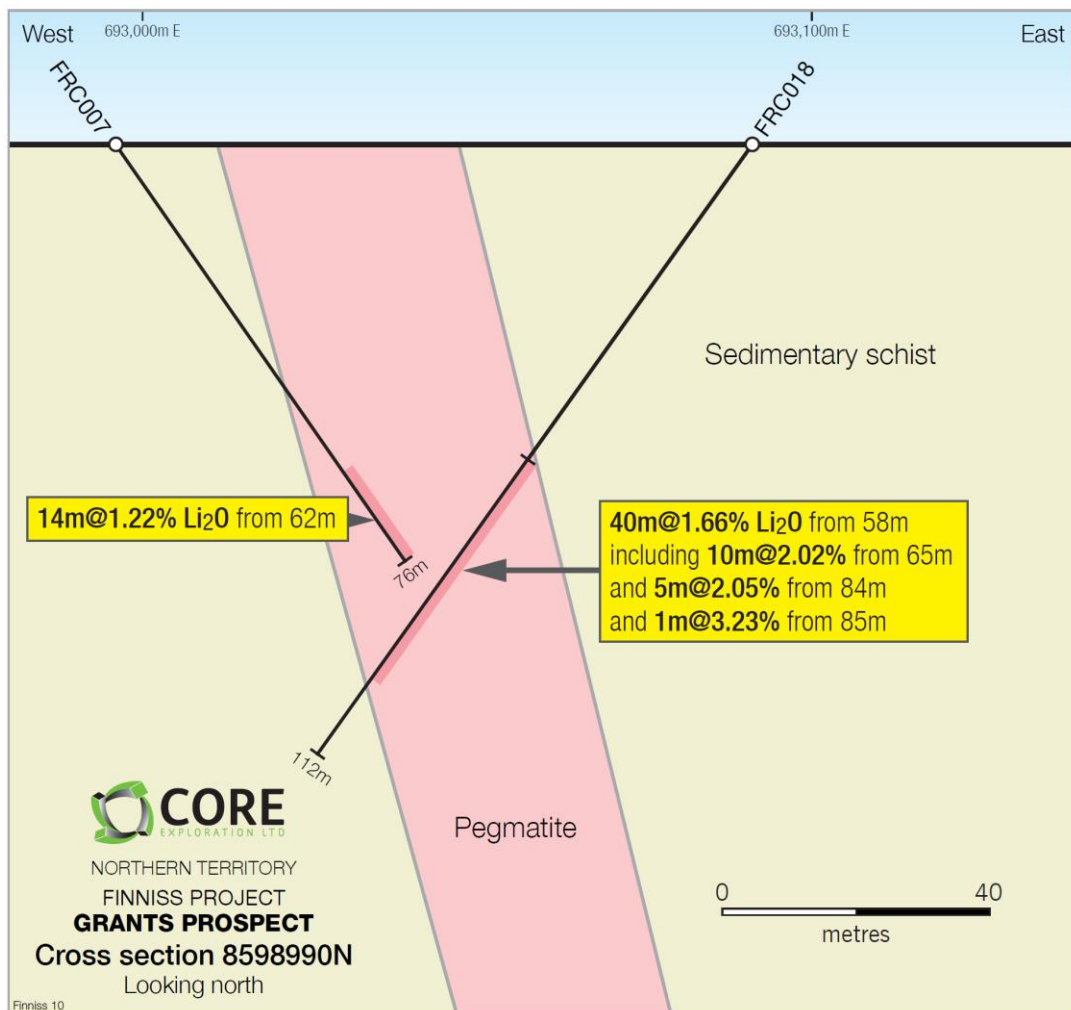

Figure 1. Recent RC Drill Results, Cross Section 8998990N (looking NE), Grants Pegmatite.

### New High Grade RC Drill Results at Finniss

Core's maiden drilling program on the Finniss Lithium Project comprised 18 RC holes for a total of 1,815m.

Significant levels of lithium mineralisation as spodumene were intersected at all five prospects drilled except for Hills (Table 1 and Figure 3).

The best new drill result from the last batch of assays is **1.66% Li<sub>2</sub>O over 40m**, containing zones of high grade spodumene mineralisation of up to **1m @ 3.23% Li<sub>2</sub>O** (drill hole FRC0018) at Grants. Other previously reported holes at Grants also returned zones of high grade lithium up to 49m @ 1.78% Li<sub>2</sub>O from 71m (FRC007).

At Grants, all holes hit pegmatite intersections over broad intervals of 30 – 50 metre widths (approximately 20-30m true width), containing high grades of lithium as spodumene mineralisation (Table 1 and Figures 1-2).

The Grants Pegmatite outcrops for over 350m at surface and is consistently intersected in all drill sections and is open to the north and south (Figure 2).

Core has now drilled the first five prospects at Finniss, with very high grade intersections at BP33 and Grants. The Company's future exploration efforts at Finniss will be focused on identifying and appraising pegmatites of an appropriate scale that display similar characteristics to those seen at BP33 and Grants where high grade lithium has been discovered.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<ul style="list-style-type: none"> <li>Sub surface chip samples have been collected by reverse circulation drilling techniques (see below).</li> <li>Drill holes are oriented approximately perpendicular to the interpreted strike of the mineralised trend.</li> <li>Rock samples comprise multiple chips considered to be representative of the horizon or outcrop being sampled.</li> <li>Samples submitted for assay typically weigh 2-3kg.</li> <li>Historic sampling and drilling techniques not described in detail.</li> <li>RC samples are homogenised by cone splitting prior to sampling and are then to be submitted for assay</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<ul style="list-style-type: none"> <li>Drilling techniques used at Finnis comprises:</li> <li>Reverse Circulation (RC) 4 and 7/8 face sampling hammer</li> <li>RC drilling techniques completed by Greenbushes in 1995 not documented in historic reports.</li> </ul>
<b>Drill sample</b>	<ul style="list-style-type: none"> <li><i>Method of recording and assessing core and chip sample recoveries</i></li> </ul>	<ul style="list-style-type: none"> <li>Sample recoveries are visually estimated and recorded for each</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>recovery</b>	<p><i>and results assessed.</i></p> <ul style="list-style-type: none"> <li><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<p>metre. To date sample recoveries have averaged &gt;95%.</p> <ul style="list-style-type: none"> <li>Drill collars are sealed to prevent sample loss and holes are normally drilled dry to prevent poor recoveries and contamination caused by water ingress. Wet intervals are noted in case of unusual result</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<ul style="list-style-type: none"> <li>Geology of the RC drill chips is logged on a metre basis with attention to main rock forming minerals within the pegmatite intersections</li> <li>Pegmatite sections are also checked under UV light for spodumene identification on a metre by metre basis</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li><i>Whether sample sizes are appropriate to the grain size of the material</i></li> </ul>	<ul style="list-style-type: none"> <li>Non core samples are collected as 1 metre samples, cone split and then sieved for geological logging.</li> <li>Assays only for the 1<sup>st</sup> four drill holes have been received or reported to date.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<i>being sampled.</i>	
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li><i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></li> <li><i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></li> </ul>	<ul style="list-style-type: none"> <li>One in twenty Lithium ore standards are used</li> <li>One in twenty duplicates are used</li> <li>One in twenty external laboratory checks have not been sent to date.</li> </ul>
