## KING GOLD PROSPECT FARMIN DRILLING DELIVERS HIGH GRADE INTERSECTION OF 10M AT 8.4G/T FROM 40M

---

**Image Resources NL (ASX: IMA) (“Image” or “the Company”)** is pleased to advise it has received encouraging assay results from initial drilling on both Image’s 100%-owned Erayinia Gold tenement and the King Gold Farmin Prospect. The King Prospect is located in the heart of, and completely surrounded by, Erayinia and Image’s adjacent 100%-owned Madoonia Downs tenement, and is located 135km SE of Kalgoorlie in Western Australia. Image’s exploration expenditures on the King Prospect are part of earn-in rights under a Farmin agreement announced to the ASX on 2 March 2021.

### Highlights:

- 10m at 8.40g/t from 40m including 3m at 25.17g/t from 47m in EYRC58.
- 18m at 1.85g/t from 82m including 2m at 4.11g/t from 88m and 7m at 2.29g/t from 93m in EYRC54.
- 10m at 1.48g/t from 96m including 3m at 3.3g/t from 103m in EYRC37.
- 4m at 1.51g/t from 41m in EYRC39.
- 4m at 1.58g/t from 33m in EYRC47.

Managing Director and CEO Patrick Mutz commented, *“The objective of the drilling program, which is positive and continuing, is to maximise Image’s ownership in the King Prospect while looking to extend the overall area and mass of gold mineralisation, increase drilling density and corroborate historic drilling results in the lead up to a Mineral Resources estimate in Q4 2021 with the goal of progressing to a scoping study in CY2022. Investigating the development potential of Image’s 100%-owned Erayinia and Madoonia Downs gold tenements and the King Farmin Prospect is one of the four elements of Image’s overall growth strategy.”*

This reverse circulation (RC) drilling program of 26 holes for 2,765m highlighted a **high-grade area that extends over a 400+m length**, as shown by the intersections highlighted in Figure 1 and cross sections 3 to 6 (Figures 4 to 7) which include higher-grade historic drilling results including, 7m at 5.63g/t from 40m in ROE782, 8m at 3.6g/t from 64m in KNRC014, 5m at 4.2g/t from 60m in KNR017, and 3m at 13.14g/t from 50m in KNRC023. The supergene zone that contains these higher-grade intersections is part of a much more extensive 1.5km x 300m zone.

---

A number of sections are open down-dip and may potentially continue at depth, e.g., cross section 3 in Figure 4 with hole EYRC58 and cross section 5 in Figure 6 with hole EYRC54. These areas are planned to be followed up in future drilling programs. In addition, the mineralised supergene zone is open to the south and an extensive aircore (AC) drilling program is planned here to ascertain the potential strike-length of this prospective gold zone (Figure 1).

The recently completed RC drilling program includes 26 holes (EYRC28-49,52-55 & 58) for 2,765m and are presented in Table 2, and involved 714, 2-4m composites and 642, 1m splits. Promising intersections greater than 1g/t are summarised in Table 1 and planned AC drilling in Table 3. This initial RC program was aimed at evaluating a promising supergene layer as well as testing for multiple stacked shallow lodes that are indicated down to a depth of 150m or greater.

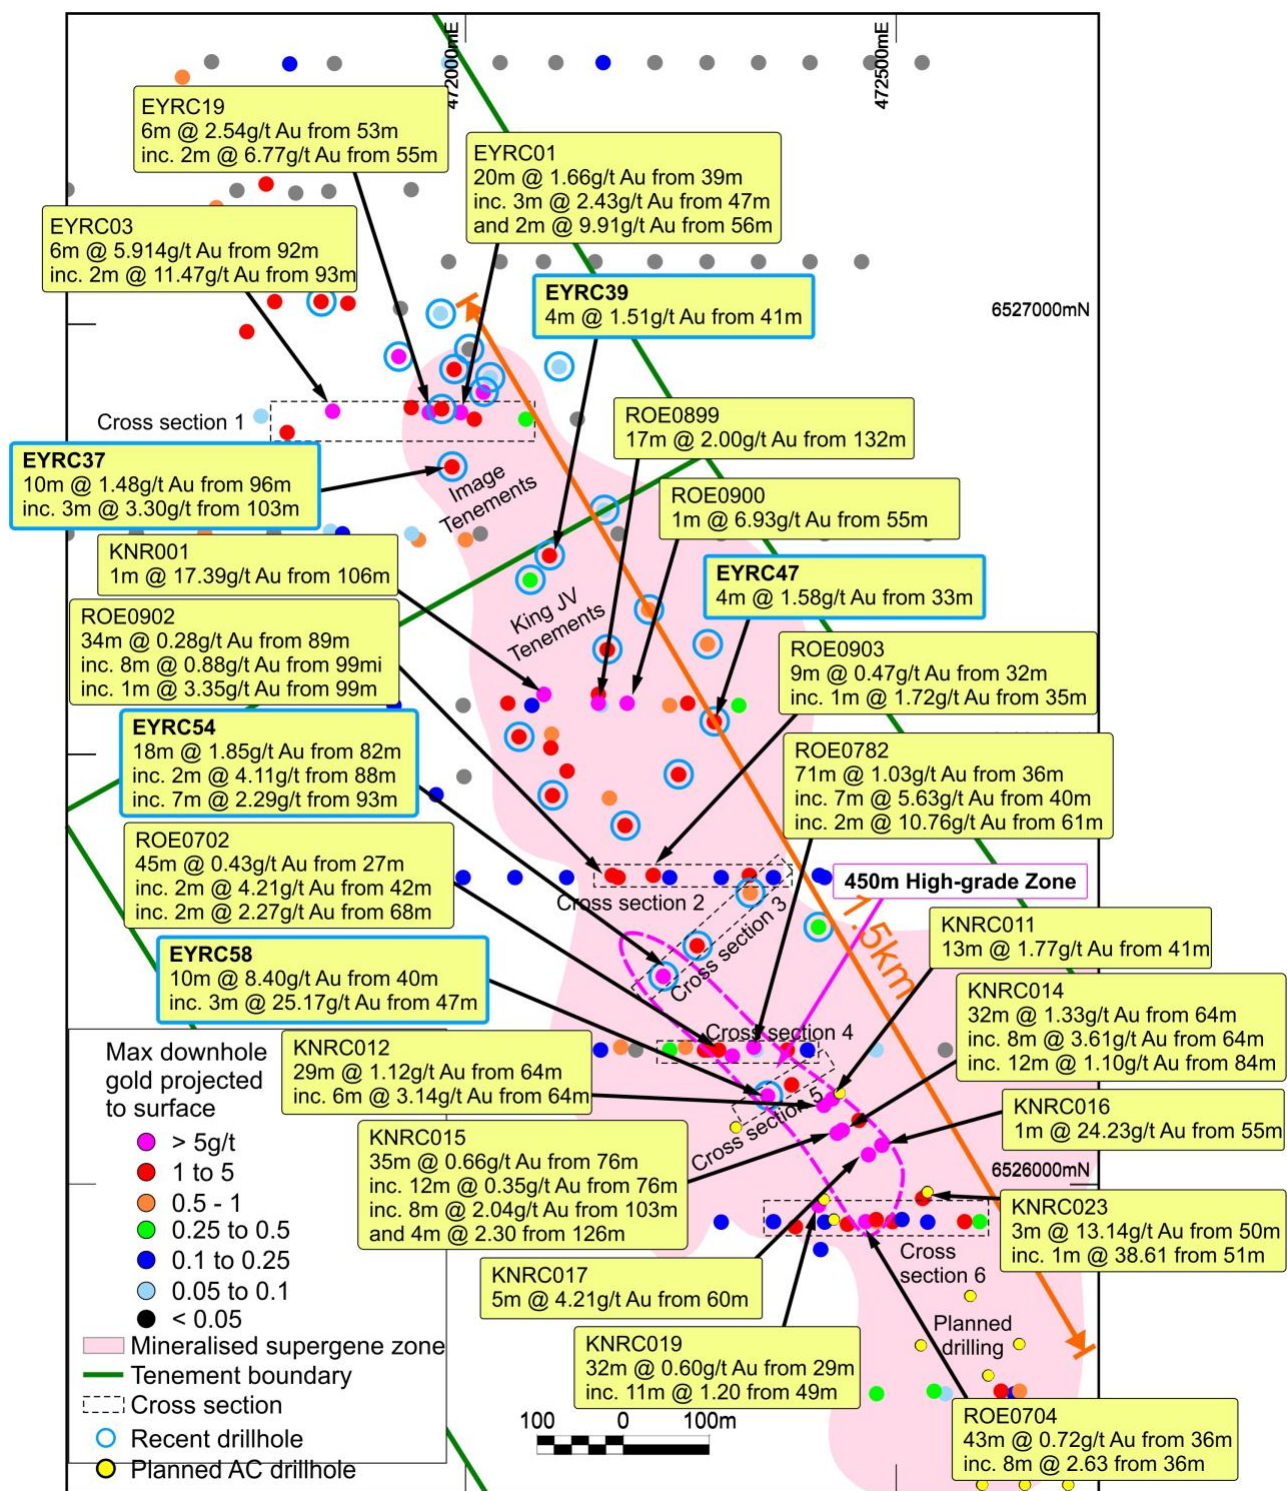

Executive Advisor - Exploration, George Sakalidis commented: *"With the Australian gold price at near record levels of AU\$2,470, Image's Erayinia and the King Prospect Farmin tenements have shown higher-grade gold intersections including 10m at 8.40g/t from 40m in EYRC58 and 7m at 5.63g/t from 40m in ROE782, as well as thicker historic intersections including 71m at 1.03g/t Au from 36m in hole ROE0782 and 29m at 1.12g/t Au from 64m in hole KNRC012, within a 1.5km by 300m wide mineralised zone. These intercepts auger well as the southern end of this mineralised zone remains open and is being followed up with an extensive aircore drilling program in Q3 2021. Initial wireframing and a resource study is planned after results are received."*

**Within Erayinia and the King Prospect there are many shallow intersections (Figure 1 and Table 1) with a total of 214 intersections (ranging from 1 to 13m) greater than 0.5g/t Au, which includes 121 intersections greater than 1g/t Au, 54 greater than 2g/t Au, 26 greater than 3g/t Au and 18 greater than 4g/t Au.**

In addition to results from the recently completed drilling program highlighted above, the previous ASX announcement dated 2 March 2021 titled "Image Resources Gold Farmin; Thick Supergene Zone Identified", regarding the King Prospect, highlighted some of the **thicker gold intersections** identified from historic drilling including:

- **71m at 1.03g/t Au from 36m in RC hole ROE0782.**
- **29m at 1.12g/t Au from 64m in RC hole KNRC012**
- **43m at 0.72g/t Au from 36m In RC hole ROE0704**
- **35m at 0.66g/t Au from 76m in RC hole KNRC015**
- **20m at 1.66g/t Au from 39m in RC hole EYRC01**
- **13m at 1.77g/t Au from 41m in RC hole KNRC011**
- **17m at 2.0g/t Au from 132m in RC hole ROE0899**

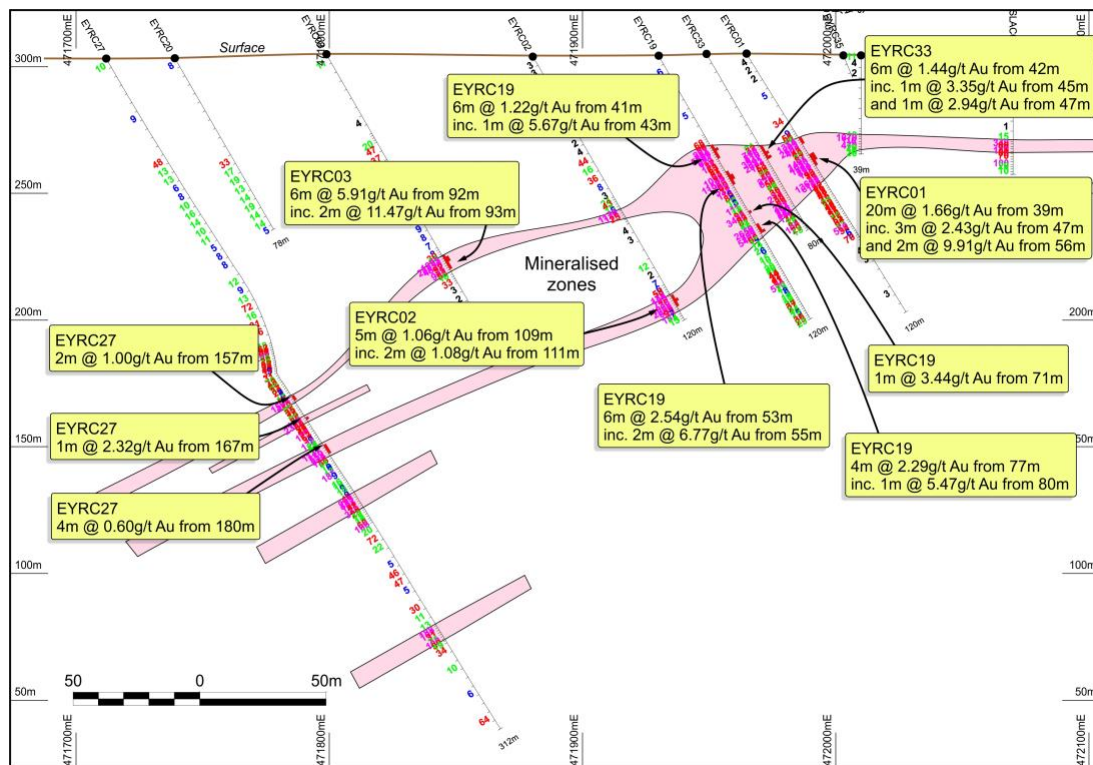

A planned AC drilling programme of 40 holes for 2,505m is scheduled for Q3 2021. The majority of holes are planned in the southern part of the King Prospect (Figure 1). This drilling is designed to potentially enlarge the prospective supergene zone southwards in areas that have not been previously drilled and potentially into Erayinia and separately to the northeast within Image's 100%-owned Madoonia Downs tenements (Figure 8).

**Figure 1: Hole locations, maximum mineralisation intercepts, enlarged supergene zone (pink shade) and recent drilling on Erayinia & King Prospect**

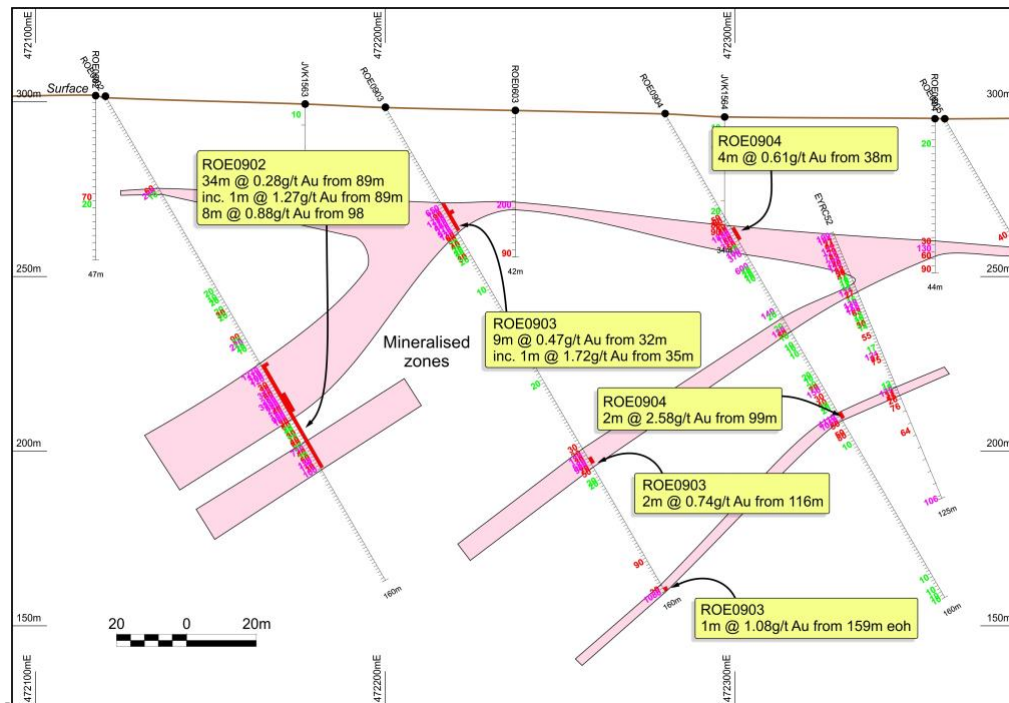

Some individual holes are also directed at testing the down-dip extension of high-grade intersections within the multiple westerly dipping lodes. These multiple stacked lodes may continue at depth and could potentially be similar to some of the larger deposits in the Kalgoorlie districts that have bulk tonnage. The King Prospect mineralisation augments the previous RC drilling activities completed by Image at Erayinia and forms a key part of a strongly mineralised zone covering a large 1.5km x 300m area.

Detailed 50m spaced caesium vapor ground magnetic surveys are also planned to help map the detailed structure within the King Prospect.

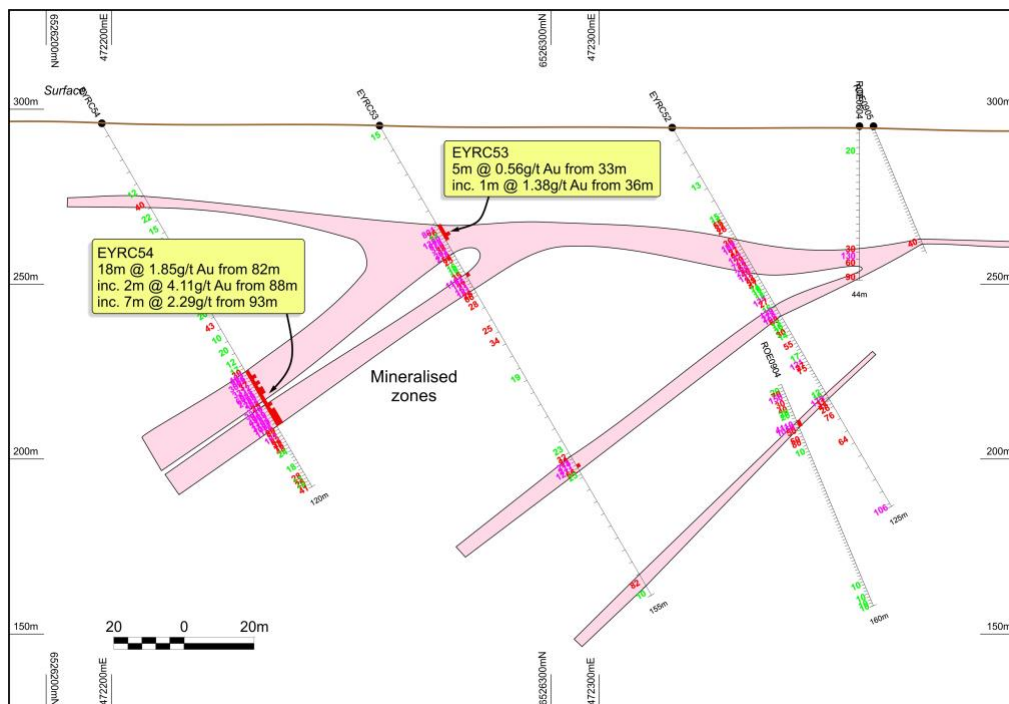

**Figure 2: Cross section 1 showing mineralised zones, significant gold intercepts on Image's Erayinia tenement. New drilling of EYRC33 on this section**

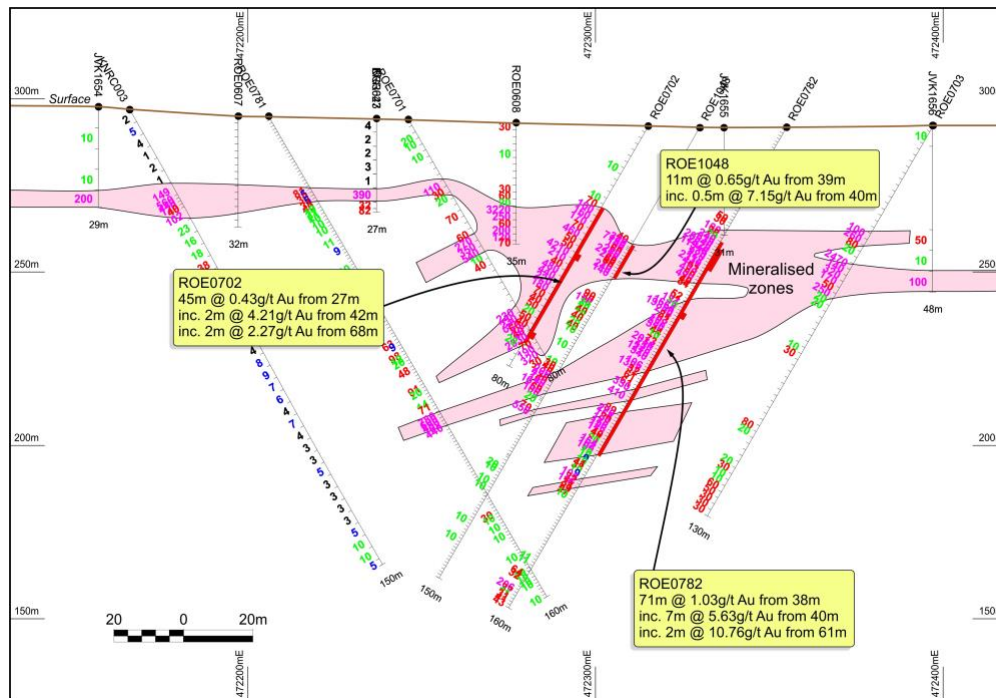

**Figure 3: Cross section 2 showing mineralised zones, significant gold intercepts on King Prospect. No new drilling on this section**

## Location within Gold Mining District

Erayinia, Madoonia Downs and the King Prospect are located within an active gold mining district. Silver Lake Resources, who own the Randall's Mill, have been processing ore from a number of satellite deposits in the nearby area including:

- Aldiss Mining Centre (includes the nearby Harrys Hill and French Kiss Deposits);
- Mt Belches; and
- Daisy Mining Centre.

Randall's Mill is reported operating at 1.2Mt per annum and Silver Lake Resources is reported to have reserves of 120,000 ounces in the area. Randall's Mill may be available for toll-treating ore from the King Prospect, which is 85km away, and the haul road starts at French Kiss, only 20km away from the King Prospect (Figure 9).

**Figure 9: Image and King Prospect tenements and surrounding mined deposits proximal to the operating Randall's Mill**

## King Prospect Farmin Agreement Background Information

On 2 March 2021, Image announced it had entered into a Farmin agreement with the owners of the King Gold Prospect ("King Prospect"), located in the heart of, and completely surrounded by, Image's 100%-owned Erayinia gold tenement in Western Australia. This Farmin represents a low risk, low-cost opportunity for Image to evaluate the King Prospect in stepwise fashion, and if deemed prospective, to earn up to 80% interest with limited expenditure.

Understanding the structural and geological model of historic mineralisation in the King Prospect, which has been shown to contain a thick supergene zone that extends into Image's Erayinia tenement, could provide insight into the potential for a much larger mineralised system within Erayinia and King.

### Key Terms of Farmin of King Prospect

1. Image has the right, but not the obligation, to spend \$330k within 24 months to earn 40% interest in the King Prospect.
2. Upon Image earning a 40% interest, a joint venture will be deemed to have been formed with Image as the JV manager.
3. Image will then have the right, but not the obligation, to purchase a further 40% interest (to get to 80%) with a cash payment of \$240,000 to the owners within 180 days of the initial 40% interest earn-in date.
4. If Image obtains an 80% interest, the owners then have the right to contribute 20% to future project expenditures to maintain their 20% ownership position, or the owners can elect not to contribute to any expenditures and instead to convert to a 2% net smelter royalty.
5. If the owners convert to a 2% royalty, they also have the right to elect that their royalty be purchased by Image at fair market value as determined by an independent organization agreed by the Image and the owners.

## Image Resources Background Information

Image is Australian's newest mineral sands mining company, operating open-cut mining and ore processing facilities at its 100%-owned, high-grade, zircon-rich Boonanarring Mineral Sands Project located 80km north of Perth, Western Australia, in the infrastructure-rich North Perth Basin. Boonanarring is arguably one of the highest grade, zircon-rich, mineral sands projects in Australia.

The Boonanarring project was constructed and commissioned on-time and on-budget in 2018. Production of HMC commenced December 2018 and ramped-up to exceed name-plate capacity in only the second month of operation (January 2019).

The Company repaid its outstanding debt ahead of schedule in February 2021 and paid an inaugural dividend of AU\$0.02 per share in April 2021, after only two years as an active mining company (CY2019 and CY2020), and is on-track to meet its market guidance for CY2021 which is similar to CY2020.

Since February 2021 Image is focused on a multi-pronged growth strategy which includes (1) maintaining its strong economic performance at Boonanarring and beyond at its 100%-owned Atlas, Helene and Hyperion projects; (2) progressing a feasibility study at its 100%-owned Bidaminna project in support of development of a second operating centre in parallel with operations at Atlas; (3) evaluating the economic potential of its two 100%-owned gold tenements and Farmin target, all located SE of Kalgoorlie; and (4) investigating opportunities outside of the Company's mineral sands portfolio to identify a project with potential mine-life of 15+ years for future development.

The exploration results reported in this announcement have been prepared and reported in accordance with the JORC Code 2012.

## **Forward looking statements**

Certain statements made during or in connection with this communication, including, without limitation, those concerning the economic outlook for the mining industry, expectations regarding prices, exploration or development costs and other operating results, growth prospects and the outlook of Image's operations contain or comprise certain forward-looking statements regarding Image's operations, economic performance and financial condition. Although Image believes that the expectations reflected in such forward-looking statements are reasonable, no assurance can be given that such expectations will prove to have been correct.

Accordingly, results could differ materially from those set out in the forward looking statements as a result of, among other factors, changes in economic and market conditions, success of business and operating initiatives, changes that could result from future acquisitions of new exploration properties, the risks and hazards inherent in the mining business (including industrial accidents, environmental hazards or geologically related conditions), changes in the regulatory environment and other government actions, risks inherent in the ownership, exploration and operation of or investment in mining properties, fluctuations in prices and exchange rates and business and operations risks management, as well as generally those additional factors set forth in our periodic filings with ASX. Image undertakes no obligation to update publicly or release any revisions to these forward-looking statements to reflect events or circumstances after today's date or to reflect the occurrence of unanticipated events.

1. exploration results for EYRC01, EYRC02, EYRC03, EYRC04, EYRC05 and EYRC06 were extracted from the Company's ASX Release dated 18/09/2018 - 20m Shallow Gold Intersection at IMA Erayinia Prospect;
2. exploration results for EYRC07 through and including EYRC23 were extracted from the Company's Quarterly Report dated 23 July 2019 for the Quarter Ending 30 June 2019; and
3. exploration results for EYRC24, EYRC25, EYRC26 and EYRC27 were extracted from the Company's ASX Release dated 02 March 2021 – Image Resources Gold Farmin: Thick Supergene Zone Identified;

all of which are available to view on [www.imageres.com.au](http://www.imageres.com.au). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and confirms that the form and context in which any Competent Person's findings are presented have not been materially modified from the original market announcements.

### **COMPETENT PERSON'S STATEMENT – EXPLORATION RESULTS, MINERAL RESOURCES AND ORE RESERVES**

The information in this report that relates to exploration results (other than those previously reported as noted above) is based on, and fairly reflects, information and supporting documentation prepared by George Sakalidis BSc (Hons), who is a member of the Australasian Institute of Mining and Metallurgy. George Sakalidis is an employee of Image Resources NL. George Sakalidis has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. George Sakalidis has provided his prior written consent to the inclusion of this information in the form and context in which it appears in this report. Mr Sakalidis is a shareholder in the Company.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representation and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Sampling and QAQC procedures are carried out using Image’s protocols as per industry sound practice.</li> <li>RC drilling was used to obtain bulk 1 metre samples from which composite 4m samples were prepared by spear sampling of the bulk 1m samples. 3kg of the composite sample was pulverized to produce a 10g charge for aqua regia/ICPMS determination for gold and pathfinder elements. The analytical results of the composite samples are used to determine which 1m samples from the rig’s cyclone and splitter are selected for fire assay.</li> </ul>
<i>Drilling techniques</i>	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Reverse circulation (RC) drilling was carried out by Image Resources.</li> </ul>
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between</li> </ul>	<ul style="list-style-type: none"> <li>RC recoveries are visually estimated qualitatively on a metre basis.</li> <li>Various drilling additive (including muds and foams) have been used to condition the RC holes to maximize recoveries and sample quality.</li> </ul>

Criteria	JORC Code explanation	Commentary
	sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	<ul style="list-style-type: none"> <li>Insufficient drilling and geochemical data is available at the present stage to evaluate potential sample bias. Drill samples are sometimes wet which may result in sample bias because of preferential loss/gain of fine/coarse material.</li> </ul>
<i>Logging</i>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>RC chips and chip trays are being geologically logged.</li> <li>Lithology, alteration and veining is recorded and imported into the Image Resources central database. The logging is considered to be of sufficient standard to support a geological resource.</li> <li>Logging of RC drillholes records lithology, mineralogy, mineralisation, weathering and colour, and is qualitative in nature.</li> <li>All drillholes were logged in full.</li> </ul>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representation of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>RC samples are cyclone split to produce a 2-3kg sample. 4m composite samples are prepared by tube sampling bulk 1m samples.</li> <li>No field duplicates were taken.</li> <li>Sample sizes are appropriate for the grain size being sampled.</li> </ul>
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers,</li> </ul>	<ul style="list-style-type: none"> <li>RC samples are assayed using a 50g charge and a fire assay method with an AAS finish which is regarded as appropriate. The technique provides an estimate of the total gold content.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p>handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<p>QA/QC measures included repeat analyses and the use of internal lab standards which indicated acceptable levels of accuracy and precision although in rare cases there is some indication of the presence of coarse gold.</p> <ul style="list-style-type: none"> <li>Industry standard standards and duplicates are used by the NATA registered laboratory conducting the analyses.</li> </ul>
<i>Verification of sampling and assaying</i>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>Where duplicate analyses of individual samples were made the analytical results were averaged.</li> <li>No twin holes have been drilled.</li> <li>Primary data is entered into an in-house database and checked by the database manager.</li> <li>No adjustment of assay data other than averaging of repeat and duplicate assays.</li> </ul>
<i>Location of data points</i>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>RC drill collars were located using a hand-held GPS with an accuracy of +/- 4m.</li> <li>Grid system: GDA94</li> <li>Topographic control using regional DEM data.</li> </ul>
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>RC drilling was carried out at 75m spacings on two lines 400m apart.</li> <li>Not for ore resource estimation.</li> <li>4m compositing was applied</li> </ul>
<i>Orientation of data in relation to geological</i>	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is</li> </ul>	<ul style="list-style-type: none"> <li>Drilling of inclined (-60deg) RC holes 90° to east or orthogonal to the target strike.</li> </ul>

Criteria	JORC Code explanation	Commentary
<i>structure</i>	<p>known, considering the deposit type.</p> <ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	
<i>Sample security</i>	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>Samples were taken to the laboratory Kalgoorlie depot prior to dispatch to Perth using a commercial freight company.</li> </ul>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>The sampling techniques and results have not been subject to audit.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>Erayinia is situated on exploration licence E28/1895 and E28/2242 108.6sqkm and is held by Image Resources NL. Image Resources is earning an interest in the King JV tenements P28/1320 and P28/1321 11.4sqkm as described in the section, Key Terms of Farm-in of King Prospect. All licences are granted with no known impediments to obtaining a licence to operate.</li> </ul>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<p>The King prospect area has been subject to systematic surface sampling by previous explorers mainly including WMC and Integra. Air-core drilling was carried out by WMC Resources and a total of 129 holes for 5402 m were drilled at the King and K5 prospects. Integra drilled 25 RC holes for 2860m and 43 AC holes totaling 1600m between 2003-2007 in the King Prospect. Available historical data has been compiled over all the tenements and the main companies include Goldfields (201 AC &amp; 22 RC), Integra (427 AC &amp; 35 RC) and Newmont (52 AC).</p>

Criteria	JORC Code explanation	Commentary
<i>Geology</i>	<ul style="list-style-type: none"> <li>• Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>• Erayinia is underlain by a moderate to strongly foliated, mafic volcano-sedimentary sequence intruded by differentiated dolerites and variably metamorphosed to upper amphibolite facies conditions. Numerous felsic porphyries also intrude the sequence. These Archaean rocks are overlain by sedimentary rocks of Proterozoic to Cainozoic age. The Proterozoic rocks are part of the Woodline Beds and are characterized by carbonate-pyrite-bearing quartz pebble conglomerates.</li> </ul>
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <li>• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</li> <li>• easting and northing of the drill hole collar</li> <li>• elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>• dip and azimuth of the hole</li> <li>• down hole length and interception depth</li> <li>• hole length.</li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>• The details of material RC holes completed historically and by Image are reported in Table 1.</li> </ul>
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>• The assumptions used for any reporting of</li> </ul>	<ul style="list-style-type: none"> <li>• No weighting or cutting of gold values, other than averaging of duplicate and repeat analyses.</li> <li>• No metal equivalents have been used.</li> </ul>

Criteria	JORC Code explanation	Commentary
	metal equivalent values should be clearly stated.	
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. The relationships between mineralization widths and intercept lengths remain to be clarified. The interface between the supergene zone and lode zones, which is the main target is highly variable and more drilling is required.</li> </ul>
<i>Diagrams</i>	<ul style="list-style-type: none"> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>Refer to text.</li> </ul>
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced, to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>Anomalous ranges used are stated in the text.</li> </ul>
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>Detailed ground magnetic survey by Image Resources.</li> </ul>
<i>Further work</i>	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not</li> </ul>	<ul style="list-style-type: none"> <li>AC drilling is planned over the prospective supergene areas mainly within the King JV tenement and surrounding Image tenements and includes 40 RC holes for 2505m. Refer to Figure 1 and Table2.</li> <li>Detailed 50m spaced cesium vapor</li> </ul>

Criteria	JORC Code explanation	Commentary
	commercially sensitive.	ground magnetics over the King JV tenements.
