ASX Announcement
21 February 2022

Further High-Grade Gold at Marymia Open-Pits

All results from first-phase open drilling campaign received

Highlights

- **Results from final 3 open-pits in 1st phase open-pit drilling campaign received – from the Redfin, Speckled and Kookaburra open pits**
- **Significant gold results returned from each pit which have extended previous known mineralised gold zones to depth at each pit**
- **High-grade gold intersected at the Redfin Pit;**
  - **3m @ 5.8g/t Au from 126m in VRERC0001 incl 1m @ 12.2 g/t Au from 127m**
- **These results appear to be controlled by a major shear which has not been well tested by previous drilling**
- **Drilling below the Speckled open pit also returned significant gold and elevated gold along a persistent mineralised structure, including:**
  - **2m at 2.8 g/t Au from 26m in VSPRC0002**
  - **3m at 1.9 g/t Au from 113m in VSPRC0004 incl. 1m at 4.3 g/t Au from 113m**
- **Drilling at Kookaburra confirmed the continuation of the mineralisation at depth, including 3m at 1.2 g/t Au from 59m in VKORC0001**
- **All results are in addition to historic drilling at these open-pits – highlight results of historical drilling are included in this announcement and will be included in a planned Marymia JORC resource upgrade due in H1, 2022**
- **Second-phase drilling completed at Skyhawk and Parrot open-pits- results pending**

Vango Mining Limited (Vango, ASX: VAN, Company) is pleased to announce results from the final three targets from its extensive first-phase open-pit focused drilling campaign at the Company's flagship Marymia Gold Project (Marymia, the Project) in the Mid-West region of Western Australia.

The latest results are from the Redfin, Speckled and Kookaburra open-pit targets, and include further high-grade gold results, at the Redfin open-pit (Figure 5).

These results complement the Company's previously announced results from the first eight open-pits, which have extended unmined mineralised gold zones at depth at each pit, and has already resulted in further drilling at the Skyhawk and Parrot open-pits with results pending.

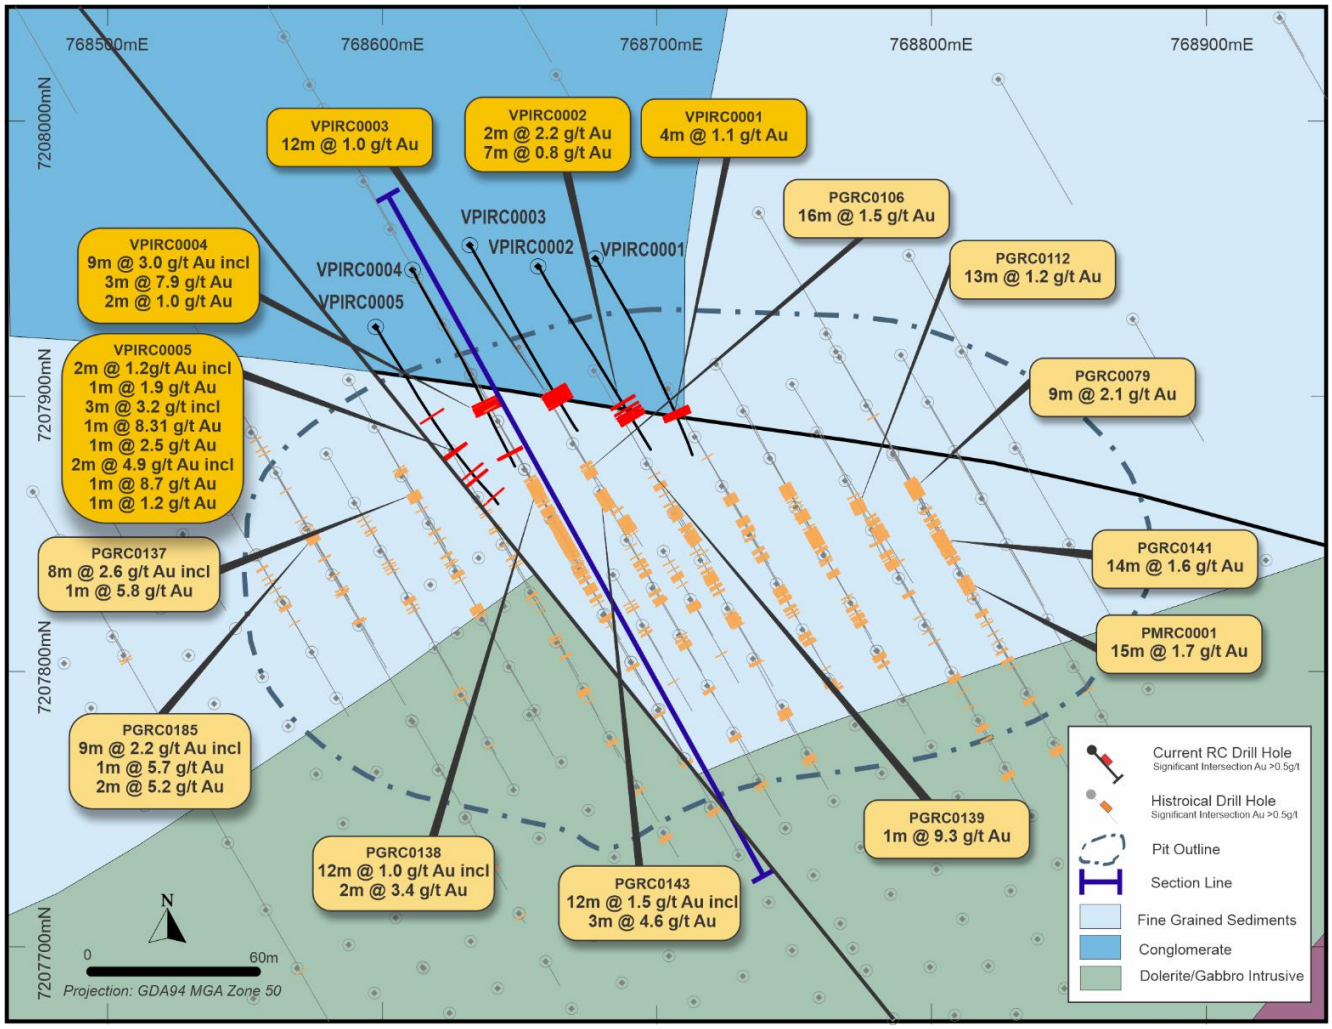

Figure 1 Plan View Redfin Open-Pit Area

Redfin Open Pit

The Redfin pit was targeted with five drillholes in the first-phase open-pit focused resource extension drilling program. Significant results were received from 4 of the 5 holes as detailed below (Figures 1 and 2):

- **3m @ 5.8g/t Au from 126m in VRERC0001 incl 1m @ 12.2 g/t Au from 127m**
- **5m @ 1.2g/t Au from 92m in VRERC0001 1m @ 2.4g/t Au from 92m and 1m @ 3.3g/t Au from 96m**
- **3m @ 1.5g/t Au from 104m in VRERC0001**
- **1m @ 2.7g/t Au from 78m in VRERC0002**
- **1m @ 0.7g/t Au from 96m in VRERC0002**
- **5m @ 0.7g/t Au from 125m in VRERC0002 incl 1m @ 1.9g/t Au from 125m and 1m @ 1.2g/t Au from 129m**
- **3m @ 1.4g/t Au from 137m in VRERC0002**
- **1m @ 1.1g/t Au from 132m in VRERC0003**
- **1m @ 1.3g/t Au from 81m in VRERC0005**

The results from these holes showed the continuity of a strong gold zone that broadly follows an interpreted mineralised structure following the contact between sediments and mafic packages.

Results from this drilling will significantly enhance the understanding of the primary zone and the controls on the high-grade mineralisation at Redfin. Importantly, the results also extend the known mineralisation beneath the existing pit, which includes the following highlighted historical intersections:

- **18m at 2.4 g/t Au from 79m in FRC1341**
- **11m at 5.9 g/t Au from 89m in FRC1342**
- **10m at 2.8 g/t Au from 90m in FRC1363**
- **12m at 4.3 g/t Au from 126m in FRC1504**

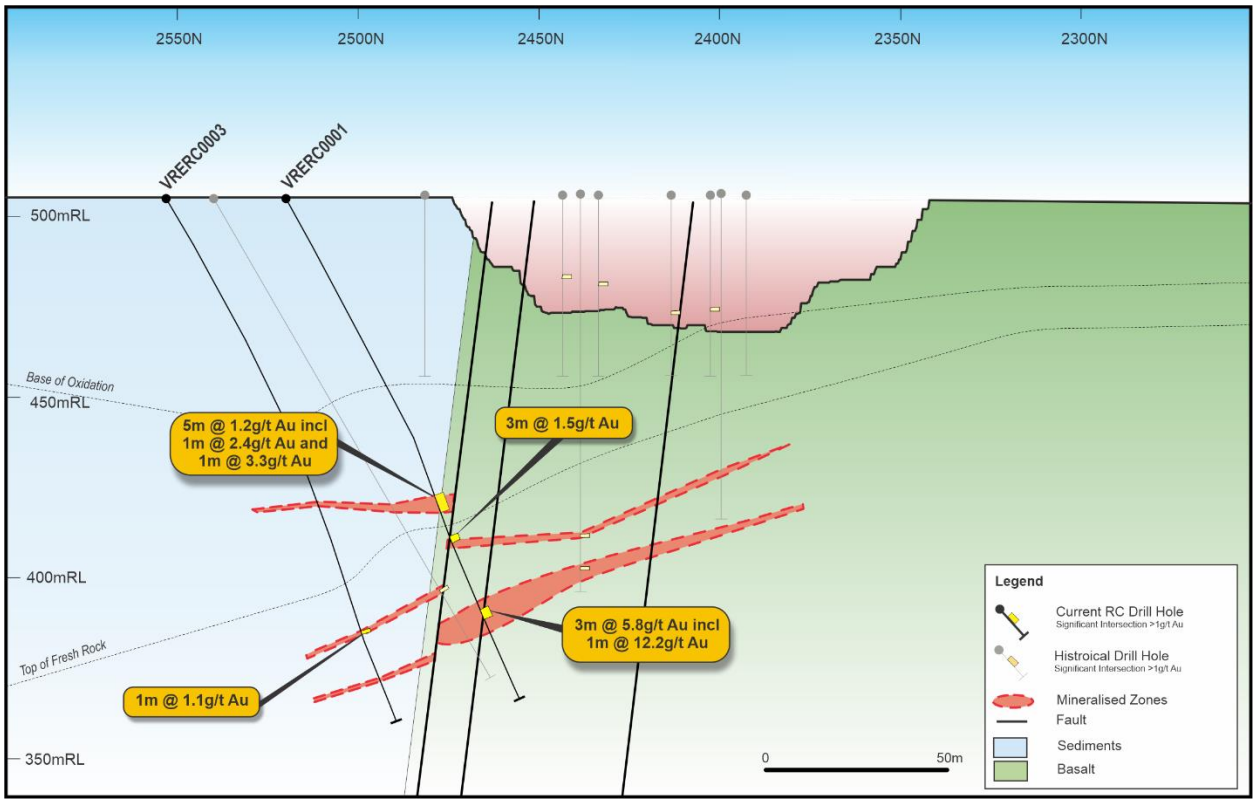

Figure 2 Cross-section Redfin 5400E

Speckled Open Pit

Results from five 5 holes drilled during the phase 1 program at the Speckled pit have also been received. Significant results were received from all five holes as detailed below (Figure 3):

- **1m at 0.6 g/t Au from 64m in VSPRC0001**
- **2m at 2.8 g/t Au from 26m in VSPRC0002**
- **2m at 1.1 g/t Au from 92m in VSPRC0002**
- **1m at 0.5 g/t Au from 65m in VSPRC0003**
- **1m at 0.8 g/t Au from 129m in VSPRC0003**
- **1m at 0.8 g/t Au from 156m in VSPRC0003**
- **5m at 0.8 g/t Au from 50m in VSPRC0004 incl. 1m at 1.4 g/t Au from 54m**

- **3m at 1.9 g/t Au from 113m in VSPRC0004 incl. 1m at 4.3 g/t Au from 113m**
- **5m at 0.7 g/t Au from 47m in VSPRC0005 incl. 1m at 2.4 g/t Au from 51m**
- **1m at 0.6 g/t Au from 112m in VSPRC0005**

Historical drilling outside the Speckled pit includes several good gold zones including:

- **9m at 1.8 g/t Au from 54m in FRC9616**
- **7m at 3.8 g/t Au from 60m in FRC9709**
- **10m at 2.5 g/t Au from 25m in FRC9716**
- **5m at 2.7 g/t Au from 74m in FRC9787**
- **5m at 2.5 g/t Au from 78m in FRC9793**

The results at Speckled show the continuity of the structure along the contact between sediments and mafics once again, with a varying tenor of gold mineralisation.

The persistent occurrence of gold in this setting throughout the drilling is encouraging, and these results will be further integrated with the previous drilling in the area to determine the potential for any significant resources. While encouraged by these results this area is likely to be a lower priority target for future drilling phases.

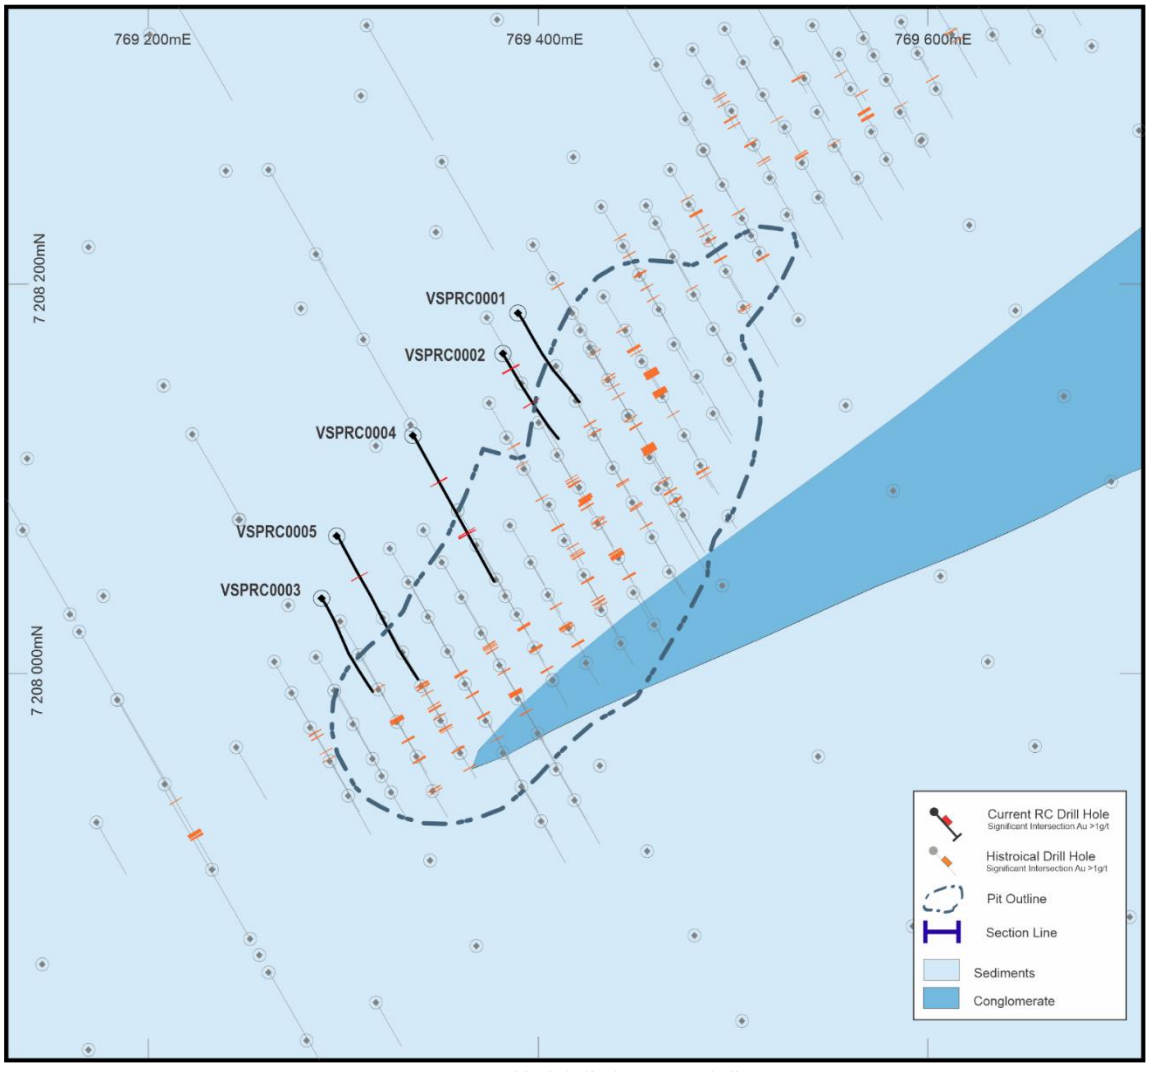

Figure 3 Speckled drill plan 2021 drilling

Kookaburra Open Pit

Results from four holes drilled at the Kookaburra pit, the final pit from the phase 1 drilling program, have also been received. Results showed once again further mineralisation adjacent and below the pit, but at a lower tenor to that in the oxide zone previously mined. The best intercept was 3m at 1.2 g/t Au from 59m in VKORC0001.

All Significant results are detailed below with 3 of the 4 holes hitting the mineralised target (Figure 4):

- **3m at 1.2 g/t Au from 59m in VKORC0001**
- **1m at 0.8 g/t Au from 53m in VKORC0002**
- **1m at 0.8 g/t Au from 70m in VKORC0004**

There are several wide gold intercepts from previous drilling outside the existing pit, including:

- **3m at 1.2 g/t Au from 47m in KBRC0009**
- **16m at 2.0 g/t Au from 25m in KBRC0019**
- **18m at 1.0 g/t Au from 42m in PBRC0079**
- **4m at 7.1 g/t Au from 47m in PBRC0118**

These results will be further modelled to determine if further work is warranted.

Open-Pit Focused Drilling Campaign Progress and Next Steps

Vango targeted 11 priority open-pits in an extensive open-pit focused drilling campaign in 2021. Drilling was designed to add resources to the substantial existing Marymia resource base, and to assist in delivering 'critical mass' to Marymia's resource base to support a proposed stand-alone mining operation at the Project.

The first phase of drilling in all 11 open pits has now been completed and consisted of 8,914 metres of RC drilling across 56 holes. All results from the first-phase campaign have now been received and reported.

Vango will now conduct follow-up, second phase drilling at targets that have delivered positive results from the completed first round of drilling, to test for further extensions of gold mineralisation to add to the Marymia resource base.

Second-phase drilling has already been competed at the Skyhawk and Parrot open-pits, and results are pending.

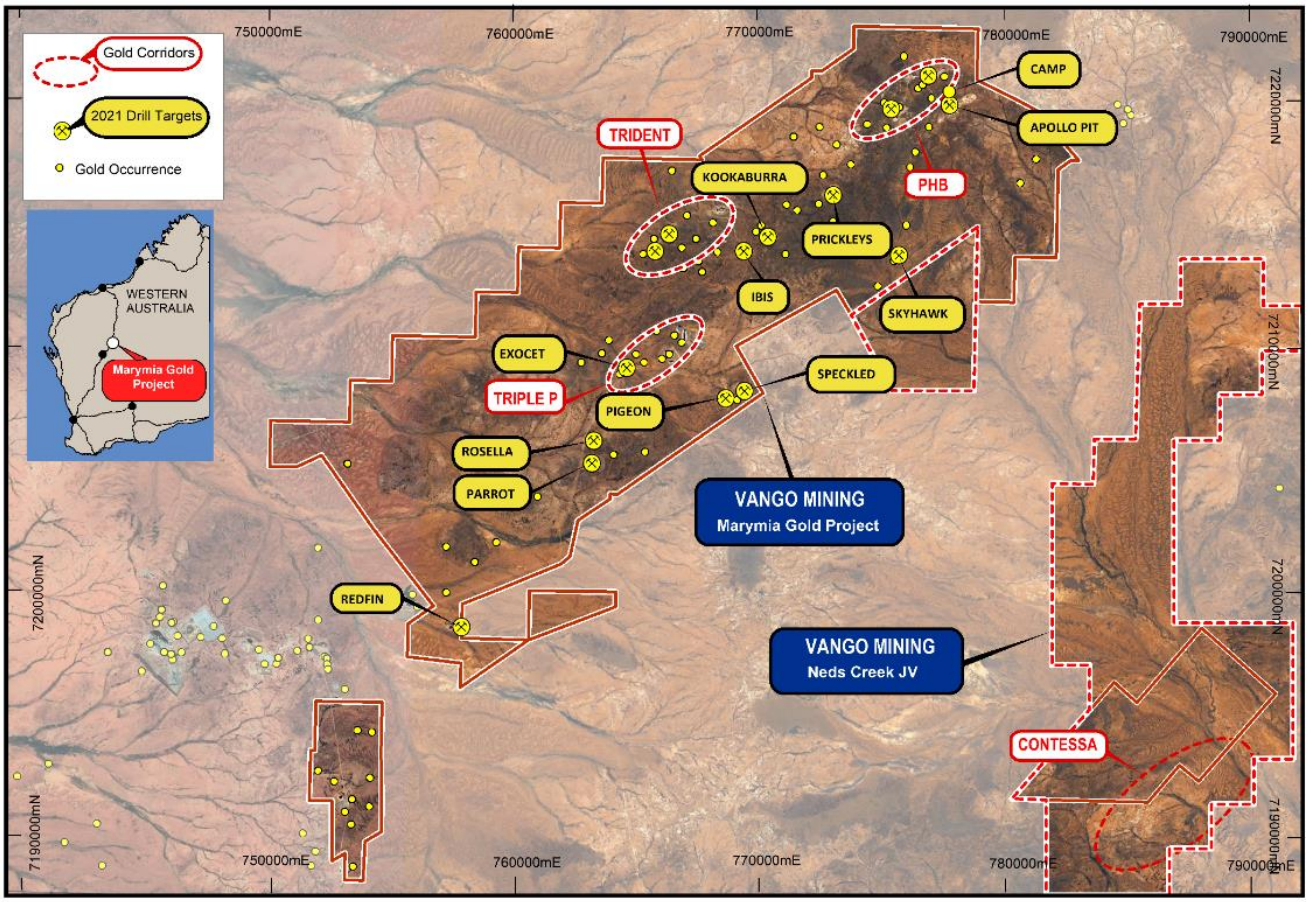

Figure 5 Marymia Gold Project showing the 11 priority open pits.

Authorised for release by the Chairman of Vango Mining Limited.

The information in this announcement is extracted from reports lodged as market announcements available on the Company's website https://vangomining.com/.

The Company confirms that it is not aware of any new information that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from the original market announcements.

About Vango Mining

Vango Mining Limited (ASX: VAN) is a minerals exploration mining company with ambitions of becoming a high-grade WA gold miner by developing the 100% owned Marymia Gold Project (**Marymia**) in the mid-west region of Western Australia. The Project comprises 45 granted mining leases over an area of 325.08km^2. It has an established high-grade resource of 1Moz @ 3g/t Au[1], underpinned by the Trident Deposit, whose resource is 410koz @ 8g/t Au, with immediate extensions open at depth/along strike.

The Marymia Project has the potential to become a significant Australian high-grade producer. The Greenstone Belt in the Marymia region includes six major gold corridors, which remain largely un-tested beyond 100m depth - supported with an extensive drilling and geophysical database. Previous mining between 1992-2001, produced 580,000 ounces of gold almost entirely from open-pits.

Vango is focused on growing its high-grade gold resource to support a proposed stand-alone gold mining and production operation at Marymia. The Project is located along strike, immediately to the north of Superior Gold's (TSX-V: SGI) Plutonic Gold Mine which has produced more than 5.5Moz of gold[2].

* VAN confirms all material assumptions and technical parameters underpinning the Resource Estimate and Reserve continue to apply, and have not materially changed as per Listing Rule 5.23.2

Mineral Resources reported in accordance with the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (Joint Ore Reserves Committee Code – JORC 2012 Edition). Open pit resources reported within optimised conceptual pit shells at A$2,500/oz gold price above a 0.5 g/t Au cut off and include oxide, transition and fresh material.

Trident underground resources are retained as first reported 18 April 2019[3] above a 3.0 g/t Au cut-off grade, and modelled at a gold price of A$2,000/oz, on the basis that the information has not materially changed since last reported. Other underground resources reported above a 3.0 g/t Au cut off (with minor 2.5 g/t Au cut-off material included for continuity purposes) and includes fresh material only. Totals may differ due to rounding, Mineral Resources reported on a dry in-situ basis.

Competent Persons Statements

The Statement of Mineral Resource Estimates has been compiled by Dr. Spero Carras who is a full-time employee of Carras Mining Pty Ltd and a Fellow of the Australian Institute of Mining and Metallurgy ("FAusIMM"). Dr. Carras has sufficient experience, including over 40 years' experience in gold mine evaluation, relevant to the style of mineralisation and type of deposits under consideration to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee ("JORC") Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves. Dr. Carras consents to the inclusion in this report of the matters based on this information in the form and context in which it appears. The information in this report that relates to exploration results has been reviewed, compiled and fairly represented by Mr David Jenkins, a Member of the Australian Institute of Geologists and a full time employee of Terra Search Pty Ltd. Mr Jenkins has sufficient experience, including over 29 years' experience in exploration and resource evaluation relevant to the style of mineralisation and type of deposits under consideration to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee ('JORC') Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves. Mr Jenkins consents to the inclusion in this report of the matters based on this information in the form and context in which it appears.

Forward Looking Statements

This announcement contains 'forward-looking information' that is based on the Company's expectations, estimates and projections as of the date on which the statements were made. This forward-looking information includes, among other things, statements with respect to the Company's business strategy, plans, development, objectives, performance, outlook, growth, cash flow, projections, targets and expectations, mineral reserves and resources, results of exploration and related expenses. Generally, this forward-looking information can be identified by the use of forward-looking terminology such as 'outlook', 'anticipate', 'project', 'target', 'potential', 'likely', 'believe', 'estimate', 'expect', 'intend', 'may', 'would', 'could', 'should', 'scheduled', 'will', 'plan', 'forecast', 'evolve' and similar expressions. Persons reading this announcement are cautioned that such statements are only predictions, and that the Company's actual future results or performance may be materially different. Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the Company's actual results, level of activity, performance or achievements to be materially different from those expressed or implied by such forward-looking information.

JORC Code, 2012 Edition: Table 1
Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• RC Drilling assays are from 1m samples cone split on the cyclone for the key intercepts. 4m composites from these 1m splits are taken in zones of lower prospectivity at the Laboratory. Where the composite samples return > 0.2g/t Au, they are re-assayed on 1m intervals • Historical drilling has been sampled on a 1m basis. By Battle Mt and Homestake Gold – split at rig. • Duplicates are taken of the second quarter of core every 20 samples to ensure the samples were representative.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Face Sampling, Reverse Circulation hammer
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• RC drilling was bagged on 1m intervals and an estimate of sample recovery has been made on the size of each sample.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Reverse Circulation holes are being logged on 1m intervals
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling*	• Duplicates taken every 20 samples by sampling a second quarter of the NQ core, or from a second split directly from cyclone. • Standards submitted every 20 samples of tenor similar to those

Criteria	JORC Code explanation	Commentary
	stages to maximise samples representivity • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	expected in the sampling. • Cone splitter on the cyclone was used to produce a 1m sub-sample on the RC rig. • Blanks were inserted every 20 samples also • In un-prospective lithologies these 1m samples were composited at the lab over 4m intervals.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Samples analysed at Intertek Laboratories in Perth, WA, using a 50g Fire Assay method. • One sample with a initial value of 8.338 g/t Au and a repeat of 22.9 g/t Au was repeated using screen fire assay which agreed with the original. Samples are dried, crushed and pulverised prior to analysis.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Intercepts have been calculated generally using a 0.5g/t cutoff and internal waste of up to 3m thickness with total intercepts greater than 0.3g/t. All repeats and duplicates have been included. • Historical work has been cross referenced against WAMEX reports A62465 (Battle Mt) and A64818 (Homestake)
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• DGPS has been used to locate the drillholes. • REFLEX Gyro Tool used for downhole surveys on all holes
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.*	• Sample data down hole is at no more than 1m intervals • Data spacing varies from approx. 20m Assessment as to whether sufficient data has been generated to establish the degree of geological and grade continuity appropriate for Mineral Resource and estimation procedure(s) is underway and, if necessary, additional drilling will be carried out to establish continuity.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to*	• Intercepts given are downhole widths with the true widths not determined.

Criteria	JORC Code explanation	Commentary
	have introduced a sampling bias, this should be assessed and reported if material.	
Sample security	• *The measures taken to ensure sample security.*	• Samples sealed in bulka bag with Security seal, unbroken when delivered to lab
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Review of standards, blanks and Duplicates indicate sampling and analysis has been effective for current and historical drilling where QA/QC has been available

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Located in the Marymia - Plutonic Greenstone Belt ~218km northeast of Meekatharra in the Midwest mining district in WA • Redfin M52/306, Kookaburra M52/218, Speckled M52/299 tenements in good standing • The tenements predate Native title interests, but are covered by the Gingirana Native Title claim • The tenements are 100% owned by Vango Mining Limited and subsidiary Dampier Plutonic Pty Ltd. • Gold production will be subject to a 1-4% royalty dependent on gold price (Currently 2%) capped at $2M across the entire project area. • Contingent production payments of up to $4M across the entire project area.
Exploration done by other parties.	• *Acknowledgment and appraisal of exploration by other parties.*	• Extensive previous work by Battle Mt and Homestake Gold
Geology	• *Deposit type, geological setting and style of mineralisation.*	
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ▪ *easting and northing of the drill hole collar* ▪ *elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole* ▪ *down hole length and interception depth* ▪ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of*	• Location of new drillholes based on surveyed sites, and DGPS, summarised in Table 1 and shown on Figures 2 and 3. • Location of previous Drillholes based on historical reports and data, originally located on surveyed sites, and DGPS. • Northing and easting data generally within 0.1m accuracy • RL data +-0.2m • Down hole length =+- 0.1 m

Criteria	JORC Code explanation	Commentary
	the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Intercepts have been calculated generally using a 1 g/t cut off or as otherwise stated (see Tables 2 and 4) and internal waste of up to 3m thickness with total intercepts greater than 1g/t. All Duplicates and repeats are included • No upper cut off has been applied to intersections.

Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.*
	  • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.*
	  • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*
		• Orientation of mineralised zones are still to be ascertained by follow up drilling.

Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Appropriate cross-sectional and plan view of the drilling are included. • Tables 1 and 3, drillhole locations and Tables 2 and 4, all significant assays, with repeats and duplicates.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Tables 1 and 3, drillhole locations and Tables 2 and 4, all significant assays, with repeats and duplicates.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Geological interpretations are included on plan views (Figures 1, 3,4,5), sectional view (Figure 2) • No new exploration data has been generated apart from the drilling information included in this report.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).*	• Extensive further drilling is planned for the project

Criteria	JORC Code explanation	Commentary
	• *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*
